But neither is there any thing of weight or moment in this that they alleadg. For I demand, what Beauty or Deformity there is in these Images and Characters? And whereas fair things delight the minde while they are seen and looked upon; how (I pray) can these things delight the mind of a Man when they are carried and worn about him covered and seldom look'd upon? And what do those various Names, (and indeed oftentimes such as are altogether unknown to us) confer and add unto the fair and pleasant conception before mentioned? And as for the Instruments of Artificers, the Figure indeed maketh much unto the operations which are by a local motion; but nothing at all unto those operations that are wrought by alterations: for in these the Figure doth nothing at all, neither can it: and precious Stones if they have any natural virtues at al in them, they put forth these their virtues under any Figure whatsoever it be. And *Galen* writeth as touching the *Jasper* stone, in the *place above alleadged*, that he himself had found by experience, that the virtue thereof was stil one and the same, with, or without the Figure of the Celestial Dragon, or the sign *Scorpio*.

Neither

Neither yet are there any other that hitherto have been able to bring any the leaſt ſhew of probability for the virtues of theſe Characters and Seals. And how indeed could they poſſibly render any Reaſons, and give us the cauſes of ſuch their abſurd Tenets; whenas they write, that theſe Seals do not only expel and drive away Diſeaſes; but that ſome of them wil likewiſe make a Man gracious unto al Men whatſoever; and that others of them will procure for a man knowledg, Wit, and Memory; others the favour of Princes; others victory in War, and Civil Cauſes; others good fortune (as they cal it) in Hawking, Hunting, Fiſhing, and Merchandiſing; and that others wil make friends to ſtand faithful unto them; others advance a Man unto the higheſt Honors and preferments; and that there are ſome of theſe Seals that wil make a Man Maſter of his wiſh whatſoever it be; and I know not what other things that theſe Seals are able to accompliſh for him that weareth them? *Rodolphus Goclenius* (the younger) taketh here a great deal of pains, and troubleth himſelf exceedingly (in his *Magnetick Synarthroſis*) and at length he diſtinguiſheth between theſe Seals; and thoſe whoſe Authors are ſaid to be *Ragael, Chael, Terel, Hermes, Salomon*, theſe he rejecteth: but there are others of them that he commendeth, to wit, thoſe Seals that are framed and faſhioned under ſome certain poſition and concourſe of the Stars, and receive naturally all their virtues from the influence of theſe Stars, and from the Connexion and Continuation of the Natural Cauſes; without any impiety, or Superſtition at al. But now what this Connexion of the Natural Cauſes is, and in what manner theſe Seals and Images receive their virtues from Heaven; theſe things he no where telleth us; neither doth he ſufficiently explain himſelf; only he ſaith indeed that theſe things are very clear, and ſufficiently manifeſted by Experiments. But the very ſame may be ſaid by *Chael, Ragael*, and the reſt of the Magitians, in the behalf and for the Juſtifying of their Seals alſo. And who is there that now adaies knoweth not, that even by ſuch like Seals very many have been made inviolable, and not to be hurt by any Weapons? And therefore the Queſtion is not here, what may be done; but the Queſtion is only from what agent theſe things are performed; and whether by a Natural Cauſe, or by the aſſiſtance of the Evil Spirit.

But now unto any one that ſhal accurately and exactly and without any prejudice weigh and conſider the whole buſineſs, it wil very eaſily appear, that theſe vertues and effects cannot proceed from any Natural Cauſe. For two things there are in thoſe Seals, the matter it ſelf, and the Characters engraven upon it; unto neither of which this virtue can be aſcribed: for the matter is from Nature, and hath in it no ſuch virtues: and this they themſelves ſee a neceſſity of confeſſing.

And here therefore for the proving of the efficacy of theſe Seals, they betake themſelves to Amulets, and pretend the virtue of them. But be it ſo indeed, that all things whatſoever are written touching theſe Amulets are true, (as moſt certain it is that very many of them are;) yet what is all this unto theſe Seals; in which if we conſider the Metals, Characters, and the like, it is without all doubt, that thoſe things have in them no ſuch virtues. And *Pæony*, the *Hoof* of the Beaſt *Alx*, and the like, do ſhew and put forth thoſe virtues that they have, albeit there be no Characters at all engraven upon them: and the like alſo *Galen* (in *the place before alleadged*) tels us that he himſelf had by experience found to be true of the Jaſperſtone.

And then as theſe Seals have not their virtue from the matter; ſo neither from the Characters, that are from the Artificer; and cannot have any ſuch virtues, either from the Artificer, or from themſelves. For why, theſe Characters are from an Idea in the minde of the Artificer, which doth not work any effect upon things external, And of themſelves they are nothing elſe but Figures. But now there is no power nor efficacy at all in Figures for the working any effect, in regard that they are nothing elſe but only qualities of a quantity. For all virtue and power of acting is principally from ſubſtance; which by its qualities is efficacious and operative. Action is between Contraries of the ſame kinde, and ſuch are not Natural and Artificial; among which are theſe Characters. Neither do things Artificial work upon things Natural, nor alter or affect them as they are ſuch: but they Act and work upon them as they have a Natural matter. And ſo on the contrary, things Natural do not Act upon Artificial things (by altering or affecting them) as ſuch, but as they conſiſt of a Natural matter. And therefore Images or Names engraven upon matter can of themſelves perform nothing; and the matter if it be at all affected by the Heavens, is equally and as much affected if it hath not any Image or Figure at all engraven upon it: and as for Characters, Figures, and Words, engraven upon the mater, they have in them no peculiar virtue of receiving the Influences of the Cæleſtial Bodies; neither can

they give any such virtue unto the Matter.

The truth is that *Rodolphus Goclenius* the younger doth indeed endeavour to give an Answer unto this objection; whilest (in his *Magnetick Synarthrosis, page* 101.) he thus writeth: *It is not the Statue* (saith he) *as a Statue, neither yet the Seal, nor the Image and figure, as such, that can affect any other Statue or quality. For the very truth is, that these Artificial Seals do acquire no virtue at al from Art; but the virtue is instilled and infused into them from Heaven, and the Stars. I say again that this same Celestial Ray, and Astral spirit that is sent down hither, and here hath its influence, (in this sublunary world) doth not only Accomodate it self unto the Metalls, Stones, and those plants aforesaid; but doth likewise secretly and imperciptibly insinuate it self into their very substance; with the which (even from the very first Creation) it hath obtained a Mutual and sympathetick familiarity, connexion, and continuation. But now this spirit hath its influence without any adjuration, Consecration, and invocation of Devills; but altogether in a Natural way.* But all that he answereth is nothing worth. For this is that very thing (according as it is in the Question) which he ought to prove, to wit, that upon Metals, and papers, ignorantly engraven and Lettered, there can any such like virtue (as is attributed unto these Seals) be derived from heaven, and the Stars. For although we do not deny, that the Stars have their secret influences upon these inferiour bodies (and therefore he hath taken much pains to very little purpose in proving of it,) to wit, that the Stars do act upon these inferior bodies not only by their motion and light, but also by their occult influence: yet nevertheless, two things there are especially of which there is great question to be made. The first is this, whether the Stars have in them any such virtue of producing fortuitous Events, and meer casualties, and such effects as are not Natural but wholly depend upon the will and good pleasure of Men. And the other is this, to wit, why they do not communicate those their influential virtues unto Metalls as they are of themselves, but only unto such of them as are engraven with Characters. For what have those Characters to do with the Stars? And what hath *Mars* in the Heavens to do with the image of an Armed man? Or what hath *Saturn* to do with an old man holding the plough? And so of all other the Planets.

And the very same is likewise to be sayd (the case standing al one) touching the signs of the Zodiack, and the rest of the Asterisms unto which Names have been given by Men according to their wills and pleasure; (for the teaching and instructing of others in the grounds of Astronomy) who could (if they had so pleased) have given some other names unto those Asterisms, which we now from them call, *Pisces*, or *Sagitarius*. Like as the Hollanders, even in our Age, have most freely (and according as they thought good) imposed names upon all those Meridional signs that they observed in their Navigations to the Southerly parts. And so the signs and figures likewise (denoting those Asterisms,) have been imposed according to the wills and fancies of Men: and therefore we conclude, that there is no Necessity at all why the virtue of any Star should insinuate it self into any such Character as is imposed meerly by the wil and fancie of Men, although it be engraven, and inscribed at such a certain time, the Star being then in such or such a position.

And therefore the whole controversy at length returns to this, that from a Naturall Cause there can no such virtue be ascribed unto Seals and such like Characters: and if there be any, (for of this very thing there is great doubt to be made; and many things without question are much talked of and boasted, which indeed were never yet experimentally found to be true) as *Paracelsus*, *Arnoldus de villa Nova*, *Thurneiserus*, (and other of our more Modern Authors) produce many things to this purpose; I say if any such efficacy be found in them, it is to be ascribed either to the imagination, (for there is none that knoweth not, that the power and strength of the Imagination is very great, and almost incredible) or else if it be not so; then of necessity it must depend upon some supernatural cause; that is to say indeed upon wicked spirits, who by such like Characters, as by certain signes, are tacitly invited and called unto, by virtue of a former Compact they had long before entered into with his Servants that engaged themselves in a League with him. For these things have their original from the Gentiles that were extremely addicted to superstition and Idolatry: and those wicked spirits made and framed unto themselves such like Seals, and Characters, to serve instead of Military pawns and pledges. And therefore they avayl from that Compact (whether explicite or implicite) to wit, that which the Devil entered into with that person who first received and suckt in this Discipline from him. Now the Devil doth this, to confirm and establish the compact, and the superstitions constituted by himself; and that he may ingraft them into the minds of Men; or else being ingrafted that he might confirm and propagate the same; and so by this, as by all other means, with-

draw

draw man and hurry him away (unto himself) from God his creatour, and from those Means by him created, and ordayned for the safety and welfare of Mankind. And therefore these things (and al other of this nature) are nothing else but certain owls or the Devills Night-birds, with which he useth to hawk for the souls of Mankind. And therefore it is by no means to be endured, what *Phedro* writeth (in his *Chirurgia minore*) that in such Characteristick Cures there lie concealed greater and more miraculous Secrets of the First Fathers and the Ancient Prophets, then is fit for us to express and discover unto others. The rash bold Man ought first of all to have demonstrated that this so great a virtue is either by God and Nature, or else by Art, put upon these Characters and constellated words (as he calls them ;) then so to have raged and railed against other Physitians, terming them (as he doth) blasphemous, and men of an ill conscience, so to detract the honour from God in these his highest and miraculous operations of the Characteristick Cure. He honoreth God who contemplateth, admireth, and Celebrateth the works of God, such as are by him created, and as they come forth of his hands. And he may truly be sayd to be injurious against God, and impious, who attributeth unto any of his Creatures those virtues which they have neither received from God, nor yet from Art.

And as for those first Fathers, and the Ancient Prophets he speaks of, who (as he writeth) used this Characteristick Cure, they are not those of whom we find mention made in holy writ ; for it cannot be proved by any Argument that these ever admitted of any such superstitious practises: but they are those that we find mention made of in *Ascelpius Hermes Trismegistus*, in these words *Because* (saith he) *that our Fore-fathers erred much against, and walked contrary unto the command of the Gods, (incredulous as they were) and not heeding Divine worship, but sleighting true Piety and Religion, they invented an Art by which they might have Gods unto themselves ; unto which when they had invented it they adjoyned that fit and convenient virtue that proceedeth from the very soul of the World, and this they mingled with the said Art. And because they were not able to make Souls, calling forth the Souls of Devills, or Angels, they conferred these upon their Images, and their Divine Mysteryes ; by which these their Idols alone might have power and might of doing good or doing Evil unto others, as they thought good.* And al others who have approved of those Characters, & defended them have been very much addicted unto the damnable art Magick, and unto all kind of superstitious practises ; to wit, the *Platonists*, (the most Studious & devout Worshippers of Devills) *Cornelius Agrippa, Paracelsus*, and others the like, very much suspected as touching this infamous Magick. Neither doth this any thing avail them, to say, that such things as these may be done, without any invocation upon the Devil, and adjuration of the Wicked spirits, and by other unlawful Means ; and that they may be wrought by a Natural power. For first of all they were to prove that these have within them those peculiar virtues that Metalls and precious stones of themselves have not ; which unless they can prove we may truly conclude that they make use of unlawful means, and such as were never ordayned by God, nor propounded by Nature for our practise. And moreover, though there appear no immediate compact with the Devil, nor any explicite Conjuration, at the present ; yet Nevertheless there may be for all this (and questionless there is) an implicite compact with the Devil ; who very well knows and is ready to acknowledg those his pawns and engagements (as it were) once given and appointed unto his followers and Worshippers. And who is there of all these who would defend these Seals from the suspition of all superstition and Idolatry, that can explain unto us what these strange and wonderful Characters (and as *Apuleius* termeth them) so lettered that they cannot be understood, and those unknown Words, which appear in the Seals that are propounded by *Paracelsus*, (in his *Archidox. Magic.* & elsewhere) signify ; or that dares pass his word, and engage his faith upon it, that these figures and unkown words are not the Devils pawns and assurances by which he obligeth unto himself his worshippers and votaries ? A German understandeth not what is written in the Turkish Language, but a Turk doth ; as likewise neither doth a Turk understand that which is written in the German tongue, which yet a German doth. And so although it be not every man that understandeth these strange uncouth Characters, or knoweth what to make of those never heard of words (not to be understood) yet notwithstanding, the Devil (as the Author of that Alphabet and writing,) understands them very well ; and accordingly being by these invocated, and called upon for his assistance, he readily affordeth the same unto the utmost of his power. And therefore, let any who so pleaseth esteem of these wales & practises, & account of them as highly as he listeth ; but as for my own part, I shall endeavour to keep in mind that first and Chief command of God ; to wit, *Thou shalt have no other Gods.*

And

And therefore seeing that from what hath been said it clearly appeareth that there are no Natural virtues in these Seals and *Periapta*; it is even from hence manifest, that these things cannot possibly render a man inviolable, and so as not to be hurt by any Weapons of War: and for this cause we have been the more large in the handling of this Controversie; and at length conclude with this, that whatsoever is attributed unto them they have it not either from Heaven, or from any other Natural Cause, but that all this is nothing else but the meer invention of the Devil; and that therefore it cannot be made use of without Idolatry. For God so formed and fram'd the Body of Man, that it should be soft, and sensible of pain, and the solution of Unity; and therefore whosoever he be that would dispose and make it otherwise, he opposeth himself unto Gods order and intention, and useth the Devils help and assistance therein. For the Cause of this effect is altogether to be referred, either unto Nature, or unto God, or unto Men, or unto those means that are administred; or else Lastly, it is to be ascribed unto the Devil. Unto Nature it cannot be referred; for she hath formed unto Man such a Body, that it may be violated by any kind of Weapons. Neither can this effect be attributed unto God, who without a Miracle doth not change the order and course of Nature. Neither doth it appear from Scripture, or any sacred History, that ever any such thing was done by God: although that (by his own command) his people have oftentimes waged most dangerous and difficult Wars against divers of their and his enemies. Neither can any such effect proceed from Men, who (as it is very well known) have no power as of themselves to perform any such thing. Neither likewise, if we consider those means, have they any power in them any way whatsoever to produce such an effect, and to invert the order of Nature. For they are either Characters, or words, or some such like thing, unto which no such virtues were every yet given and granted either by God, or else by Nature. And therefore it cometh al (at length) to this, that such things as these are performed by the help and assistance of the Devil. For albeit there are many who think that there passeth no commerce at al betwixt them and the Devil, although they shall make use of such means: yet notwithstanding these ought to know, that such means as they (first of all) have no warrant from God, so neither were they invented by Men, but suggested unto those persons (even by the Devil himself) who at first entered into a league and Covenant with him; and therefore they are to know, that all those that make use of them do make themselves partakers of this compact, as we have often said before.

And that the evil and wicked Spirit doth meerly Cheat and delude men by these *Periapta* appeareth even by this, that when men have thought themselves by this means, and in this manner, sufficiently fenced and guarded against the violence of all kind of Weapons; there were others found that were able to Nul, Dissolve, and quite take away that inviolability, as they term it, and proof against the force of Weapons; and so when they least of all look for or suspect any such thing, they perish in this their superstition.

And the truth is, the waies they have to uncharm the Body, and to render it penetrable by Weapons or Gun-shot, are for the most part (as they say) of very little weight or moment; but they are (I confess) unto me altogether unknown: and yet notwithstanding from the Relation of others (of the vulgar people) it plainly appeareth that those *Periapta* have no power of fencing and preserving the Body against bullets of Silver; as also that a mans Body cannot be made inviolable, if the Leaden bullet be but never so little chawed in the mouth: if the Swords point be heated in the Fire, and then anoynted with Sewet; if the Sword be run into the ground, or thrust into bread; and if many other such like things be done; in which to be curious is neither my business, nor intention. But this will most certainly from hence appear, that the Devil is a Lyar, and that he keepeth not the Covenant and Compact he entereth into with his Servants; but that he oftentimes Cheateth and Deceiveth them; and that when he communicateth that Art unto Men, he doth not this that he may benefit them; but only layeth Snares for their Souls, whilest he most of al pretendeth and promiseth the making of their Bodies safe from all manner of injuries. Of which there are extant many instances and examples; and among the rest, remarkable is that example which happened at *Misnia* in the Moneth of *February*, this very year 1634. For there (at *Misnia*) when as a certain Souldier (in his Cups) was boasting and making his brags (with that solemn, but yet now adaies too common an adjuration among the Souldiers, *Let the Devil fetch me*, or, *the Devil take me*) that he was inviolable, and impenetrable by any Weapons whatsoever; and that he might give them an experiment to confirm the truth of what he had said drew forth a short Sword, and therewith he violently smote twice upon his naked

Breast,

Breaſt, (inſomuch that the Sword was even bowed and made crooked thereby) and yet had no hurt at all by thus doing; but when he attempted to do the ſame the third time, then the Sword ſuddenly penetrated into his Breaſt, and pierced even unto his very heart; and ſo this miſerable wretch periſhed in this miſerable manner.

And therefore let every Chriſtian and pious Souldier be hereof warned that he make not uſe of any ſuch wicked and unlawful means (as being and proceeding meerly from the Devil) but that he content himſelf in the ſafe guarding of his Body by lawful Arts and waies; and as for all other things, let him commit them unto almighty God, who hath our lives in his Hands; and without whoſe will there is not one hair can fal from our Heads.

THE FIFTH BOOK, THE FIFTH PART.

Of Fractures.

Chap. 1. *Of Fractures, and the Cure of them in General.*

THat which in a ſoft part is called a Wound, the ſame is in a hard part, and bone, called a *Fracture*, (by the Greeks properly termed *Agma*, and *Catagma*) which is a diviſion or ruptrure of the bone, from ſome external Cauſe violently ruſhing and breaking in upon it. Now as for thoſe that have written at large and very accurately touching Fractures, they are (in the firſt place, and eſpecially) *Hippocrates* in his *Book of Fractures*; and *Galen* in his *Comment* upon the ſaid Book; and in his *ſixth Book* of the *Meth. of Curing*, *Chap.* 5. and 6. And among the more modern Authors, and thoſe of our own time, *Hieronymus Fabricius ab Aquapendente*, in his *B. of Chirurgery*, *Tit. of the Fractures of the Bones*; and theſe Authors you may have recourſe unto, for your more ful ſatisfaction in ſo weighty a point: in the mean time I ſhal endeavour briefly and plainly to Contract the whole ſubſtance of the ſubject in Hand, and ſo to ſet it before you.

The Differences.

Galen (in his *ſixth B. of the Meth. of Curing. and* 5. *Chapt.*) telleth us what theſe Differences are. For ſomtimes (ſaith he) the bones are broken tranſverſly; and then it is chiefly and properly to be termed a Fracture; but then indeed if the bones be ſo broken, that by no Art or means that can be uſed the ends and extreme parts of them may be brought and made to ſtick faſt together as before, and that they lie not directly one againſt the other, this kind of Fracture is (in ſpecial) called *Cauludon* from the reſemblance and likeneſs that it hath with a broken ſtalk. And *Paulus Ægineta* writeth that this *Cauludon Catagma* is likewiſe called *Raphanedon*, and *Sicnedon*, from the ſimilitude of a broken Raddiſh and Cucumber. But if the bone be not only broken into two parts, but that it be likewiſe ſhivered into many, that Fracture is termed *Suntrimma*, or *Comminution*; and by *Galen* it is alſo called *Caruedon*, becauſe that it is made after the manner of broken Nut-ſhels. But if the bones be cleft according to their length like as Wood is cleft, it is then called *Parameces*, that is to ſay, (properly) a right or ſtraight *Fiſſure* or Cleft; and by *Galen* it is termed *Schidacedon*. In the Head, this ſpecies of the ſolution of Unity hath names peculiar and proper unto it; touching which ſee *Hippocrates*, in his *B.* of the *Wounds of the Head*, and in his *firſt B.* of *Practiſe*, *Part* 1. *Chap* 23.

And of theſe Fractures there are likewiſe ſeveral other differences; for ſome of them are great, and ſome again but ſmal Fractures, ſome of them ſimple or ſingle Fractures, and all but one alone; but then another Fracture there is that is manifold, as conſiſting of many; ſome equal, others unequal; and the bones are alſo broken ſomtimes in one manner, and ſomtimes in another manner, and that very different. And the truth is, the Ancients gave them their names from the Figure and the likeneſs of other parts; and (as we told you before) they called them *Cauledon*, *Raphanedon*, *Sicnedon Catagma*; and ſomtimes likewiſe *Alphitedon*, when the bone is broken and ſhattered into many ſmal and thin parts, *not unlike unto Meal*; they cal another ſort of Fracture alſo *Calamedon*, that is to ſay, the *breaking of a Reed, eis Onucha, after the form of a Nayl.* All which Appellations notwithſtanding are for the moſt part ſleighted and neglected by *Hippocrates*, who inſtead of them hath made uſe of

Names

Names more ordinary and usual, as one rather desirous to interpret, and choosing rather by speaking of them in more words, so to describe them. And sometimes al the parts of the broken bone do again Joyn and grow together; but sometimes some one or other parts of the broken bone impostumateth and droppeth out.

There are likewise divers other differences, that are taken from the part affected. For one is said to be a Fracture of the Shoulder; another of the Arm, another of the Thigh; and so of the other parts. And then indeed in the Arm, either but one of the two bones, or else both of them (to wit, the *Ulna*, and the *Radius*, bones) are broken. And in like manner it is also in the Thigh, the case being one and the same. The bones of the Nose are likewise broken; and so are also the Channel bones, the Ribbs, and the whirl-bone.

And there are moreover (besides these) other differences that are meerly accidental; when as a bone broken either abideth stil in its own place, or else is carried forth thereof, and lifted above some other bone; and that sometimes the Fracture is but newly made, and sometimes it is old, and of a long continuance. And there are also other differences, that are improperly so called; as that a Fracture is conjoyned sometimes with a Wound, sometimes with a Luxation or disjoynting, and sometimes with other affects. For sometimes there is a Fracture made, the Skin and Flesh lying above it stil remaining sound and whole; and sometimes these happen likewise to be hurt and wounded. And sometimes also together with the Fracture there happeneth a loosening of the Joynt neer unto it. And sometimes unto a Fracture there happen an extraordinary pain, a swelling, and an Inflammation: but sometimes again, there are none of al these joyned with, or following upon the Fracture.

The Causes.

Now all things may be said to break the bones, that so endeavour to bow and bend them, that they (being not flexible) must necessarily be broken. *Galen* (in his *second B. of Fractures*, and *Text* 9.) reduceth them all unto four Causes, whiles he writeth after this manner: *It is either something* (saith he) *that can bruise and batter, if it be laid on with great force and violence (and this without doubt ought to be some Body that is hard of substance, and heavy in its weight:) or else it is somwhat that doth not only divide the Skin, or that divideth likewise something that lieth under the Skin, even unto the very bones, but which divideth also the very bones themselves: which Malady* Hippocrates *himself indeed calleth* Edra, (*that is to say, a* Decession) *in his* B. of the Wounds of the Head. *And moreover also some by leaping from an high place have broken either the Ankle or the Thigh bone; which in these persons were drier, and not so thick perhaps as in others. For I my self also have seen in the common wrastling, when in the turning of a man round a Fracture hath happened unto him, who having hereby had his Ankle together with the Calf of his Leg broken by the greatness of the Wound the bones have been made naked and bare. For this Fracture happened upon his Ankles being gotten under the Leg of his Adversary that wrastled with him, in a transverse or overthwart manner; so that both the Heads thereof, as well that toward the Foot, as that above toward the Knee, were pressed downward with great violence: like as we also see it in Wood, which we our selves endeavour by bowing and bending it round to break. For if a piece of Wood be put upon ones Thigh, and then from both ends or Heads pressed down vehemently with the Hands, we shal then soon perceive it to be broken in the middle part.*

But yet notwithstanding even the very Constitution of the bones doth sometimes cause the Fracture of the bones; the Constitution of them being sometimes so brittle, that it cannot brook the least violence; and sometimes again more hard; so that it cannot be broken but with a far greater violence and force. And rottenness likewise rendereth the bones very frail and weak, and especially that which followeth the French Pox, and in those that often make use of Mercurial Inunctions. Of this strange and wonderful frailty and weakness in the bones there is extant a Memorable History in *Marcellus Donatus*, in his *Hist. Medic. Mirabil. B* 4. *Chap.* 5. And the story is briefly this: Vincentius Morellus, *Coach-man unto that Famous Poet, and Noble Patrician,* D. Dionysius de Pietis, *sporting, and playing the wag with others of his fellow Servants, snatcht up half an Orange from off the Table, and threw it as hard as he could at the Head of his fellow Servant running before him; but as it fel out, he did himself more mischief then the other. For in that Arm wherewith he threw (by reason of the strong and forcible motion) the bone of the right Shoulder was so broken, that the Heads of the broken bone being disjoyned one from the other, were easily and manifestly found to be so even by the touch. But strange it is to hear what followed. This bone was no sooner splinted and bolstered up with Iron plates (in regard that he could not now do his business as formerly) but at midnight lying in his bed, and awakening, he puts down the other Arm to reach himself the Chamber pot: in which Mo-*

tion

tion the bone of the left Arm was broken about the middle of it; and this was likewise set and bound up by the help of the Physitian. This Man for many yeers before had been sore troubled with the French Pox in a most grievous manner; in so much that his Head, Legs, and Arms were ful of hard knotty swellings, which at length by his often anoynting them with Unguents of Hydrarge, seemed to sink down and disappear. Wherefore we can think no other, but that the rottenness eating through the bones of the Arm, and thereby vitiating and corrupting them, made way and gave occasion for this so easie and much to be admired Fracture. Two Histories Paralel to this we meet with in *Schenckius* (in his 5. *B.* and 8. *Observat.*) from the observation of D. *Camerarius*. For *Capivaccius* had sometime related unto him, that a certain person in throwing an Almond shel against the pavement, instead of breaking that, brake his Arm. As likewise he related of another, that but knocking something with a Mallet, (and that not very hard neither) brake his Arm likewise. Two other such Histories we meet with in *Guilhelm. Fabricius*, in the 2 *Century of his Observations*. The first is of *Philibert Sarrazenus* (a Physitian of Leyden) who writeth unto *Fabricius* (*Observat.* 66.) in this manner: *A certain man* (saith he) *a Citizen of Leyden* (*threescore yeers of Age*) *was tortured with an obtuse and dull pain* (*for the space of almost two moneths*) *proceeding from a Flegmatick Gout in the Joynts of his Shoulder and right Arm. Remedies he used none all this while: only he procured what rest he could for that part, by having the Arm affected wrapt up in a Swathe, and continually resting upon his Breast. He being otherwise very sound and healthy, about eight of the Clock in the morning goeth forth abroad unto the shops; and while he was fitting on a Glove upon the hand of the right Arm,* (and that as gently as he could) *he brake the bone of his Arm* (*transversly or overthwart*) *four or five Fingers below the Shoulder. I being sent for went immediatly unto him, and there I beheld the whole business as it was, not without very great admiration; I searched the Arm and Shoulder; and by a Chirurgeon I restored the bone unto his former place, and commanded that convenient Remedies should be administred, and applied unto the part affected. After three daies I went again to visit this Patient, that I might search and find whether or no all things had been rightly ordered and applied. And having removed the Swath-bands and the Splinters, we saw that the bone was returned unto its Natural Scituation; and we soon perceived it to be so by pressing down our Fingers upon the place. But Lo, a little below this, about the Joynt of the Elbow, a new Fracture of the same bone* (*which as yet we had not seen*) *offered it self unto our view; very sad and grievous pains excruciate the Patient; and therefore we again betake our selves with all diligence unto our work, and endeavour again the restoring of the broken bone unto its proper place. Upon which al things succeeded well, and the pains were all calmed, insomuch that now he taketh very comfortable rest: but yet nevertheless, from that time forward the Swaths were never unfolded; neither was he ever seen* (*hitherto*) *to make any use of that part. And that which made me so much to admire the strange and wonderful unwonted frailty and brittleness of the bones in this Person, was this, that he altogether denied that he had been at any time troubled with any affects of the bones, contracted either from the Joul Disease, or from any other cause.*

The other History we find in the *sixty eighth* of his *Observations*, in these very words: *Philibert Brachlea* (of *Sequsium*) *being now in the fifty nineth yeer of her Age, of her own accord and without any manner of violence externally offered unto her by any whomsoever had her bones broken, so that she died thereof, in the yeer* 1606. *This Woman whiles on the Lords day* (*which it seems according to the Rite and Custon of the Country was held more sacred then ordinary*) *she was in the morning putting on a new Smock petticoat, lifting up her Body as she lay in her bed, and her Hands stretched forth above her Head, she perceived* (*by the great pain she felt on the sudden*) *that she had not only dislocated, but broken the bone of one of her Arms; so that there was need of the Chirurgeous help: who when he had fitly put together the extreme parts and ends of the broken bones, and bound them up with Swaths, he moreover outwardly administred fit and proper Remedies, and so at length had the happiness to Cure that affect. But this miserable and unfortunate Woman was no sooner freed from these streights, but she must yet again fal into a worse mischance, and undergo the violence and grief of a greater Malady. For when as at last* (*after that she had now a long time kept her bed*) *she desired to be raised up out of it by the help of her houshold Servants; before she went to the Fire side, her Maid that then waited upon her in putting on her Stockings,* (*so soon as ever she had but endeavoured it*) *only laying on her Hands to help her Mistress, brake the bone of her right Leg in a transverse overthwart manner; which the Chirurgeon again repaired. In these troubles and griefs the poor miserable Woman lived for the space of two yeers; and having al this two yeers time been troubled with divers Fractures, and innumerable pains from day to day) she had at length her life shortened and taken away by them.* And the Author of this Observation writeth, that the strange

and much to be admired fractures in this woman were not caused either by the French Pox, or from any other Diseases, she having not been at any time affected with the one or the other; nor ever in all her life troubled with any such sickness. But his conjecture is, that the true cause hereof was some occult and secret poyson, proceeding from some extraordinary and notable corrupting of the humors; which up and down, on all sides passing throw the whole substance of the bones corrupted it in this strange and unexpressible manner.

Signs Diagnostick.

A Transverse fracture, or that which is made in an oblique manner may easily be known, because that by the very touch the extremityes of the broken bone (being now separated) are soon discovered; and likewise in the place of the fracture there is found a Cavity, or hollowness that is not Natural. And moreover the body, and especially the broken Member cannot be moved after the due and wonted manner. And there ariseth likewise, before the bones be set and brought together again into their places, an extreme and most intollerable pain, whiles that the extremities of the broken bone prick and grate upon the parts nigh unto them, being very quick of sense and feeling. Which that it may be the more rightly known, the member that is found is to be compared (as Arm with Arm, Leg with Leg) with that that is broken. And very often also it so falls out that by reason of a broken bone the Member is made shorter then it should be, whilest the Muscles draw up the inferior part of the bone. And for the most part likewise fractures are generally and commonly well known; some violent causes (having power enough to break the bones) usually preceding. But then those fractures that are made longwayes in the bone, are not to be known but with more difficulty: and yet notwithstanding they may be discovered from the preternatural thickness of the Member, as also from the inequality, and pain thereof.

The bones oftentimes likewise impostumate and drop forth, to wit, when all their small parts and little pieces could not be brought back and set in their proper places, and thereupon are left destitute and naked of flesh: and this is known by the blackness of the bone, (if at least it lie open unto the view) or else by the stirring and moving up and down of the bone, if it be found not to adhere and stick close unto the other bones.

Prognosticks.

1. The fracture of the bones made according to the length of them is more easily cured then that fracture that is made either in an oblique, or in a transverse manner. For there is no such need of any laborious replacing of the bones; but it is sufficient, if the bones (gaping as it were) be again Joyned close together.

2. Among the Transverse and oblique fractures, that is most easily Cured (and hath least of danger in it) that is single or simple, and equal; and in which the broken bones are not at al moved out of their places.

3. Those fractures in which the heads of the broken bones are retuse and blunt have but little of danger in them: but when they are sharp-pointed, those fractures are the worst and most dangerous of any; inregard that they are not easily to be set close together (as having nothing of any blunt bone to rest upon) and because they also hurt and wound the flesh, and sometimes likewise a Nerve or Muscle, as *Celsus* tells us in his fifth Book, and *Chap.* 7

4. The fracture is then very difficult to be cured, when the bone is divided into many fragments; and the more the smal pieces are, still the more difficult is the Cure like to prove: and so also when there are sharp pointed stickings out, which prick and wound the parts that lye neer unto them.

5. By how much the greater the fracture is, and by how much the greater also the broken bones are, with so much the more difficulty and slowness is the fracture Cured.

6. When two bones Joyned together (as in the Arm, the *Radius* and the *Ulna*; in the Leg, the Ankle and the *Fibula*) are both of them broken, the Cure will be more difficult then if only one of these be broken. For if one of these bones remain whole and unbroken the Muscles cannot then so easily be contracted, as being kept stretched out by the unbroken bone. And so likewise when the broken bone is set again in its former place, if the other be whole, that serveth instead of a prop unto that which is broken; and a greater help and benefit it is unto it, then are either the swathes or the splinters, or both of them together. But on the Contrary, if they be both broken, al things that are performed in the keeping in its place the bone after it is set must be done with far greater Care, curiosity, and pains-taking.

7. The Fracture that is made in the middle of the bone is to be accounted lighter, and less dangerous then that which is nigher unto the head of the bone, whether it be the superior

perior or the inferior head. For whereas nigh unto the lower head there are many Tendons, and neer unto the upper head very many Nerves; the greater are the pains that are excited; and the Cure is rendered so much the more difficult. But if the fracture be nigh unto the Joynt, it is then the most dangerous of any, in regard that there are in that place both Tendons, and Nerves, and Ligaaments; and because that the broken part cannot there be so conveniently bound up; and because also, in this bloodless and cold place the heat is but very weak. And albeit that the fracture may in that place be consolidated; yet nevertheless it leaveth behind it a great impediment in the motion of that Member, by reason of the *Callus* which bindeth (as it were) the Tendons or Muscles.

8. A new fracture is very apt and ready to be consolidated. But if there be any time delayed, the Cure is thereby altogether rendered the more difficult; not only because that upon the happening of the inflammation that extension of the part (which is required) cannot be performed without much danger; but likewise because that the extremities of the bones become hardned, so that they can never after this be brought to Joyn and grow together again; and this more especially happeneth in aged persons. And therefore we must endeavour all we can that as speedily as may be the Extremities of the bones may be fitted and Joyned together the one to the other; for so by this means they wil afterward the more easily grow together again: for be it how it will, if so be that pain and an Inflammation happen upon the fracture, they render the Cure the more difficult.

9. If in a fracture of some one of the more eminent bones the fit and Convenient Cure thereof be protracted and put off beyond the seventh day; there wil then be danger lest that something of the bones be be nummed & impostumated; as *Galen* tells us, in his third Book of *Fractures Text.* 37.

10. And so likewise if there be a Contusion of the flesh, and a wound Joyned together with the Fracture, the Fracture is then very dangerous; and so much the more dangerous, by how much the wound is the greater; and especially if any of the greater Muscles (as of the thigh and shoulder) shal be Wounded. For then Inflammations do very easily happen; and at length, the *Gangrene*, and *Sphacelus*. And that likewise which here maketh the Cure to be the more difficult is this, to wit, that the splinters (and the other like things that are necessarily required for the keeping of the bones in after they are brought back unto their proper places, cannot so conveniently and fitly be administred, in regard that a hole is to be kept open for the better curing of the Wound.

11. If the bones be so broken and shattered that they cannot be reduced unto their former wonted State and place, we cannot then any wayes promise unto the Patient the recovery of his perfect health again: for although the bones may possibly grow together again; yet Nevertheless the Member is by this means made much shorter then before, and so altogether unfit for the discharge of its former offices.

12. The bones when they are so broken that they cannot possibly be restored again, we must then know that it will not be long ere they be impostumated, and fal forth; and so wil likewise those that are wholly destitute and bare of flesh: so *Hippocrates* in his third Book of *Fractures, Text.* 44. Now the bones impostumate, and drop out, sometimes sooner, and somtimes it is longer ere this be done. Those bones are sooneſt separated that are sooneſt withered, and sooneſt driven forth by the flesh growing underneath them. And therefore the smal bone is sooneſt impostumated and separated, and that bone likewise that is in some extreme part, and the bone also that is but thin; whereupon it is, that in less then fourteen days such bones as these last spoken of use to be separated. But the greater and more solid bones are longer ere they impostumate and separate; for it is both a longer time ere they are withered, and likewise ere they are driven forth by the flesh that groweth up underneath them: and hence it is, that they are seldom or never impostumated and driven forth before the fourtyeth day at the sooneſt; but now and then the impostumation and dropping forth of the bone is deferred unto the Sixtyeth day, and oftentimes also for the space of many Months. Yea and sometimes it so happeneth that the small fragments of bones shattered and broken al to pieces have not broken forth untill after many yeers; as we have an instance hereof given us by *Guilhelm. Frabricius*, in his 4. *Century.* and 97. *Observation.* And I my self likewise know a very eminent Commander, a Captain of foot, who at *Norinberg* was with a bullet shot throw the right Arm; by which his shoulder bone was broken; out of which wound even until this very yeer 1634. there brake forth fragments and smal pieces of Bones.

13. The Age likewise, the temper, and habit of the body, the course and kind of life, the time of the year, the Region, the state of the Heavens, and even all things else

whatsoever that have in them a power of determinating the Natural strength (either by augmenting or diminishing it) these al may render the Cure more or less difficult. And therefore it is that the Curing of a Fracture is in young persons a matter of no great difficulty; but in such as are aged and decrepite the cure is much harder, yea and oftentimes altogether impossible.

14. Fractures with an Inflammation and a bruising of the flesh are ful of danger; in regard that those cannot be fully and entirely Cured, until these shall first of all be perfectly healed.

15. Touching the time for the Consolidation of a fracture, there can nothing of a certainty be foretold; seeing that it differeth, and is very various according to the Age, habit of the body, the time of the yeer, and other such like Circumstances. For in such as are young, if they be of a good habit and Constitution, and observe a good and orderly Dyet, and live under a temperate Clymate; the bones in these are much the sooner consolidated: but far more slowly in aged people, and such as are more weak and infirm.

16. And lastly, the Fractures of the Nose, of the Jaw-bones, of the Throat, of the Breast, of the Shoulder blades, the Ribbs, the Spina or back bone, the Ankle, heel, Hand, and Sole of the foot, are consolidated betwixt the twentieth and the twenty fourth day; those of the Leggs and Arms within Thirty five daies, or betwixt the 35. and the fourtyeth day.

The Cure.

The Simple or Single fracture (being as it is a species of unity dissolved) hath even one only common and universal indication, to wit, that what is thus disjoyned must again be united. And although that this uniting be the work of Nature, as in Wounds; yet nevertheless, that Nature may the better attain unto her scope, and effect her purpose, there are yet many other things necessary. To wit, whereas the broken bones are for the most part removed out of their due places; if this shal so happen, then the broken bones are again to be restored unto their own proper places; and then in the next place, they are with all exactness and accurateness to be fitted and joyned together, as before in their Natural state; and so being in this exact manner conjoyned, they are thus to be kept. Which things when the chirurgeon hath with all his skill and dexterity accomplished, the Uniting afterward of the bones, and the generating of the *Callus*, are to be committed unto Nature, as her proper and peculiar work. And yet Nevertheless, the Physitian ought not to be remiss in affording unto Nature the best of his help and furtherance: and this he may do, if he do what he can for the preserving of the Natural temperament of the part; and take care that the inflammation and all other the Symptoms that usually accompany and attend these fractures, and disturb nature in her work, be prevented and kept off. Or if they shall at all happen, that with what speed he may he remove them.

What things are necessarily required for the Curing of broken bones.

And therefore, in the first place, (as *Cornelius Celsus* teacheth us, in his *B.* 8. and *Chap.* 7.) we are to be wel advised upon mature Consideration, whether the broken bones be fallen out of their places, yea or no: for it is alwaies so, that when the bones are broken in a transverse or overthwart manner, they fal out of their own natural Seats. Now it is known that the broken bones are not removed out of their proper places, if in the place where the fracture is there be no Cavity or hollowness perceived, neither any sense of pricking; and that the Member doth not appear shorter then before. And therefore in this kind of fracture there is not any need at all that the member be any whit extended; or that we trouble our selves in the least with the returning back and fit joyning together of the broken bones. For it may so very easily come to pass (if this be but attempted by us) that pains may be excited, & the heads and such parts of the broken bones that stick forth may hereby be crushed and grated one against another, and so broken: but here we are only to endeavor, that the broken bones may be kept in their own Natural Seats, and there again united, as anon we shall further shew you how this is to be done.

But if the broken bones shall be fallen out of their own proper places, so that one shal be carryed forth and cast upon another, then in this case our first and main Care ought to be, that these broken bones may again be restored unto their own places. Now this is to be done (chiefly and primarily) by two operations, the former whereof is called Catatasis or *Antitasis*, i. e. *an Extension*; but the other we term *Diorthosis*, *i. e. Conformation* or a putting back again of the bones into their own places. But now, so it is that none can rightly perform these operations, but he that wel understandeth the Nature of the bones, and knoweth the differences of fractures. The Nature of the bones is to be known out of *Galen his tract. of the bones*, & the books of other Anatomists; especially by our own ocular

ocular inſpection, and taking a right view of them in our Anatomy Lectures. And for the differences of Fractures, *Galen* (in his *ſixth B.* of the *Meth. of Curing*, and 5. *Chapt.*) tels us what they are.

And firſt of all therefore in the reſtoring and returning back of the broken bones into their places, there is requiſite an extenſion of the part. For when as without the Cutting aſſunder of any Muſcle either the parts of the broken bone are removed out of their proper places, or elſe that the Joynt is fallen forth of its due place, the Muſcle whoſe beginning is annexed unto that part into which either a part of the broken bone inclineth, or the Joynt falleth forth unto, is wholly drawn back unto its own Head; and ſo by this means together with it ſelf it carrieth along that part of the Member which is Joyned with it. Wherefore it cannot poſſibly be that either the broken bone ſhould be rightly conformed, or that the looſened bone ſhould be again reſtored back unto its own place and ſeat, before that it be ſo much drawn back as it was before removed out of its place into this or that part. For otherwiſe, if (to wit) there be not made a right extenſion, in Fractures, by attrition the eminencies (or parts ſticking forth from the bones) would be broken, by being cruſhed together one againſt the other, ſo that they could not poſſibly be put back again into their own places and Cavities, but that they muſt either externally ſtick at the ſides of the bones, or elſe they muſt ſtil remain among the broken bones, and by this means the Coaptation and due Joyning together of the bones ſhould be very much hindred.

Extenſion how to be performed.

And therefore that the broken bone may be rightly conformed, it is requiſite that both parts of the broken bone be diſtended backwards, or otherwiſe as need ſhall require; and this extenſion is by the Greeks called *Antitaſis*. But that the extenſion may be rightly done, we muſt endeavour that it may be performed either with no pain at all, or no more then needs muſt. Now this will be done, if the member to be extended be placed in ſuch a Figure as wherein the Muſcles do nothing at all, but all of them are as it were idle and looſened; that ſo all the Fibres of the Muſcles of the ſaid member may be extended directly and ſtraight forward: by which means there wil be need of the leſs extenſion, and the whole buſineſs performed with very little or no pain.

Now this extenſion and diſtraction is to be done either by the labor and pains of one alone, or elſe by the Hands of many together; and this indeed likewiſe either by their Hands only, or elſe alſo by certain Reins or Curbs, or by Swaths, or other Engines and devices uſed for this purpoſe. When the Finger is broken, or any other tender member, the extenſion may then be performed by the help and pains of one alone, who is to lay hold on one part of the broken member with his right Hand, and on the other part with the left, and ſo drawing them apart one from the other: or elſe it is to be done by two together, ſo that one of them may hold the part of the broken member, and the other extend and ſtretch it forth. But if the member that is broken be greater and more ſtrong, then the help of many together will be needful; ſo that one may indeed with both Hands lay hold upon one part of the broken member, and another at the ſame time may likewiſe lay hold with both Hands on the other part of the broken member; that ſo they may by drawing towards them (one from the other) bring the ſaid broken Member cloſe together. And ſomtimes likewiſe there wil be need of binding it round about with Swaths, Linen Clothes, and Staies; and of fitting theſe on all ſides unto the ſaid broken Member, like as with a Cord, or Nooſe; for the drawing of all which together, (that it may be rightly done, to wit, by drawing ſeveral waies, the one from the other) the help and aſſiſtance of divers at once will be very requiſite. And oftentimes likewiſe, even then when there is occaſion for a greater extenſion (but yet without any violence) there are together with theſe certain Engines to be adminiſtred; touching which, ſee *Hippocrat.* in his *ſecond B. of Fractures, Text* 40. &c. *and Oribaſius*, in his *Tract. de Machinam.* and *Paræus*, in his 15. *B.* and 7. *Chapt.*

Now this Extenſion is either equal, or Unequal. We cal that an equal extenſion, in the which the Member is equally extended from both ſides of the broken bone: but the extenſion wherein the Member is more extended from one ſide of the broken bone then from the other, we then cal it an Unequal extenſion; and this hath then is place, when but only one of the two bones in the Ankle or the Elbow is broken: for that ſide is moſt to be extended in which the broken bone is contained.

Extenſion how manifold.

But now the *Diorthoſis*, or Conformation, is the replacing and putting back again of the broken bone into its own place, and the right Coaptation or fitting together of the extreme parts of the broken bone; which is done, if after that the Member is ſo far forth extended that the bones to be replaced cannot

Conformation.

be

be brought to touch one another, the Chirurgeon with both Hands lay hold on both parts; and that he then thrust back unto the right part the Member that is fallen forth unto the left; and so on the other side, that he thrust back unto the contrary part that Member that is fallen forth forward; and so on the Contrary; and that he never leave thrusting back the Eminencies or stickings out of the bones into their Cavities and hollow Seats, until the extremities, *i. e.* the ends of the bones be rightly united, and driven back into their proper places, and that the Member have recovered again its Natural Figure. But now these stickings out of the bones are not with any impulse or violence at all to be thrust back again into their Cavities, lest that by this violent handling of them they should be broken; but rather let them of their own accord (the extension being loosened) return back into their own seats; and let them be gently directed hereunto by the Hands of the Chirurgeon. And all these things are (as soon as may be) to be done, before that an Inflammation happen: for if there chance to be any Inflammation, and then afterward the extension of the Member, and the replacing of the bones be attempted, a Convulsion may easily be excited.

But if the Chirurgeon be not called until the Inflammation be already begun, so that by reason thereof the bringing back of the bones may not so much as be attempted, then by all manner of means he ought to oppose the Inflammation; and he is likewise to endeavour that it may speedily be removed by those Medicaments that are above propounded, in the *first Part*, and 5. *Chapt. of an Inflammation.* And in the mean time he ought to be very Sollicitous and Careful of the part affected, lest that it readily receive the fluxion: and this may be done by Repellers; and by placing the part in such a manner, and so handling it, that no pain at al may be brought upon the Patient. When the Inflammation is over and past, we must after that endeavour that the bones may be reduced unto their proper places.

But then if the extremities of the broken bones break forth, and stick out of the Skin, by what way and means such a Fracture is to be Cured, we shall shew you in the *Chapter following.* When these things are thus performed, we ought then to take good notice, whether or no the bones be rightly fitted and placed together. Now it may be known by this (as *Hippocrat.* telleth us in his *third B. de Officin. Medic. Text* 24.) if the Patient be no longer so much infested with pain, as before; if the eminencies of the bones now conjoyned within themselves do no longer prick the part; if while the broken part is touched by the Hand there be perceived no Cavity, no sticking out, or unevenness; and if the broken Member being compared with its fellow that is sound, (that is to say) the Shoulder with the Shoulder, the Thigh with the Thigh, and the Legg with the Legg, it be found to be almost equal, and like unto it, both in its Figure and Magnitude. Almost, I say, indeed, because that in the thickness there may be some kind of difference betwixt them; in regard that by reason of pain and the afflux of Humors, the broken Member doth for the most part swel up and grow somwhat big.

When we find and are sure that the bones are conformed, the extension is then by degrees to be remitted; and we are then to take care that by a fit binding up of the Member the bones when they are wel fitted and placed together may so remain united, and rightly conformed. And this is to be done by two other operations, to wit, the binding up and the placing of the Member. Wherefore there are some who write, that the Curing of Fractures cannot be performed and compleatly finished, but by these four operations, *viz.* Extension, Conformation, Binding, and placing of the Member.

The binding up of Fractures.

Notwithstanding, before ever we attempt to rowl any Swathe about the broken Member, some certain Medicaments are wont to be applied and laid on, for the preventing the afflux of Humors, and the Inflammation, and likewise for the helping forward of the *Callus* that is to be generated: but in this, for the matter thereof, Authors do somthing differ. *Hippocrates* maketh use of a *Rose Cerote*: *Celsus* useth Clothes dipt in Oyl and Wine. Others there are, who at the first lay upon the Fracture a *Cerote* of *Roses* with a broad Linen Cloth, and then afterward they put upon it a Linen Cloth well moystened in sharp black Wine, or else the Juyce of Pomegranates: others use hurds moystened throughly in the white of an Egg shaken well together, and then a little Squeezed: and others (which practice is now adaies most in use) do anoynt and spread upon a Linen Cloth a mixture made of the *white of an Egg*, and Astringent Pouders of *Bole-Armenick*, *Dragons blood*, *Roses*, *Pomegranate flowers*, *the Roots of Consound*, *Frankincense*, and the like; and this they lay upon the Fracture. Which said Medicaments are in all the bindings so long to be continued, even until there shall be no further fear of an Inflammation, and that the Fracture begin now to be stable: and afterwards we are to apply (if it be in the Summer) the *Diapalma Emplaster*;

plaster; but in the Winter the *Emplastrum Barbarum*; or some other that is in all respects suitable and Convenient. And this diversity of the Medicaments seems upon very good ground (and not without Cause) to have been brought into use and practise by Authors. For when there is an Indication of Strengthening and Establishing the Fracture (and that pain and the fear of an Inflammation forbid it not) the *white of an Egg*, and astringent Cataplasms are made use of: but if the Patient be afflicted with sore pain, then we are to use the *Cerote* and *Oyl of Roses, and Wine.* Or,

Take *of the dead head out of Lin-seed, Lin-seed powdered, unsalted butter, Roots of the greater Comfrey, of each four ounces; Bole-Armenick, and Ceruss, of each one ounce; the whites of fifteen Eggs; Make a Cataplasm; let it be put upon the Fracture, and after two daies removed. Repeat this five times, one after another.* Or,

Take *of the finest Flower half a pound; Mastick, and Gum Arabick, of each one ounce; Mummy, and Bole Armenick, of each half an ounce; with the whites of Eggs make a Cataplasm.*

Very useful likewise is the Emplaster of *John de Vigo*, which he mentioneth in his 8. *B.* and 6. *Chapter.* And *Guilhelm Fabricius* in his 4. *Cent. Observat.* 99. useth this Emplaster.

Take *of* Slobanus *his Emplaster four ounces; Powder of the Root of the greater Comfrey, of Red Roses, and Myrtles, of each two drams; the Stone Osteocolla prepared, six drams: mingle them together over a gentle Fire, with a little of the Oyl of Roses, and make an Emplaster.*

The common and vulgar Chirurgeons (in Fractures) are wont oftentimes (even at the very first) immediatly to apply the *Oxycroceum* Emplaster: or if this be not the very first of all, yet it is a Remedy that they never fail to make use of within a very few daies after the Fracture is made. But this cannot be done without much danger; as in *the place alleadged Fabricius* sheweth us by an example. For it being so that this Emplaster heateth the part affected, and thereby attracteth the blood and Humors, it must needs produce an itching, pain, Inflammation, and Gangrene; and especially in the Body that is Cholerick and Cacochymical.

After that fit Medicaments have been imposed upon the part affected, then we must proceed to the binding of it up; and this must neither be over loose, (lest that the bones be again removed out of their places) neither over streight and hard, lest that it hinder the afflux of the Aliment, and excite pain. Now this is to be performed with two Swaths; the one whereof (which may not unfitly be first moystened with *Oxycrate*) is to be cast over the Fracture, and upwards to be rowled round about it twice or thrice, (so that much of the sound part be taken in in the Swathing) that so the bones when they are set back again into their places may there be kept and continued; and likewise that the conflux of blood unto the affected part may by this means be prevented. The other (longer then the former by the one half) is to be rowled about in a Contrary manner; and being first of all cast upon the Fracture, (and beginning from the same) it is some certain times to be rowled about downward, and then again to be drawn up above the said Fracture; and at length to be carried toward the sound part lying above it. For so by this means, if it should so happen that by the first Swathe any Muscle should chance to be distorted and made to stand a wry towards some one part, it is amended by the second; the Humor is likewise pressed forth of the part; and the influx of the blood, (as well from the inferior, as the Superior parts) is hindered and prevented. For all bindings whatsoever have in them a power of pressing forth the Humors out of those parts upon which they are first of all cast, into those parts where they are ended.

And this binding which is performed by these two Swaths, is by *Hippocrates* called *Hypodesis*; and the Swathes themselves he calleth *Hypodesmidai*. But now that in the greater bones the binding may be the more stable and firm, certain coverings (which the more modern Authors term *Plagulæ* and *Splenia*) are to be put above upon them; and then after the putting on of these, the binding is to be made firm and strong by two equal Swath bands (which *Hippocrates* calleth *Epidesmoi*) of which the one is from the lower part carried upward toward the right hand, or toward the left; and the other is carried downward, the quite contrary way unto the former: which binding is by *Hippocrat.* termed *Epidesis.* And here we ought to be very cautious, that the binding be not either in an over-loose manner (for this will not sufficiently retein and keep in their places the bones that are newly brought back) or else too hard and close; (for this may cause pain) but shunning the inconvenience of both the former, we are to make choyce of that middle way, that so we may enjoy the benefit and usefulness of both. And if a few Swathings about be not sufficient to contein and keep in the Fracture; then it will be best, for the more security, to add unto the number of them.

And

Splinters to be put upon Fractures, to strengthen them.

And that the bones when they are reduced unto their proper place may be there the better established and kept firm, (that they be not again moved out of their places, *Ferulæ* (or Splinters,) are to be put above upon them, if the Nature of the place affected will bear the same. For seeing that Swathes and the Coverings which they cal *Splenia* are very flexible and yielding, they cannot possibly keep the Fracture firm and direct, but that it may easily happen, that whether the Patient wake or sleep, the Member may be moved. And therefore that in those motions which are not much heeded the Member may be kept firm, and held tight, there will be need of those things that are stiff, and are not easily bowed, and yet nevertheless not over weighty and ponderous. Unto which end and purpose (as *Hieronymus Fabricius* speaks) *Hippocrates* could not in all the world again (after his *Plagulæ* or Coverings) have invented and fitted us with better instruments then these *Ferulæ* or Splinters, that are both stiff and inflexible; and likewise very light, and not at all oppressing the part affected by their weight. But when we want these Splinters, we may instead thereof make use of thin pieces of Wood. And some there are that in the place of these *Ferulæ* make use of the Rinds or Barks of Trees. But if any wil make use of these, let him look well to it, that they be not green, but throughly dried. For those that are green, when once they become dry, they then are contracted about the Fracture, and do excitē pain; and somtimes also they again remove the bones out of their places; as *Guilhelm. Fabricius* by a peculiar example teacheth us, in his *fourth Century*, and 89. *Observat.*

The placing of the broken Member.

And Lastly, (if need so require) the pipe may likewise be administred unto the Member; touching which both *Hippocrat* and *Galen* make mention, in their *Tract. of those things that ought to be done in the Curing of Fractures*, *Text* 18. and the member is rightly to be placed; and we must see well to it, that its position be soft, equal and even, and turned upwards: soft, that so it may not press together the broken Member in that part, neither cause pain and inflammation: equal and even, that it may produce no pain, nor cause the Member to stand awry: and it must be turned upwards, that so the Humors by their weight tending downward may not flow unto the place affected. But more especially we must do our endeavour, that there may be observed a middle Figure of the Joynts; and so likewise a middle figuration of the Muscles: unto which end also there may be somtimes administred certain little Coffers or Caskets (the Latines cal them *Capsulæ*) which all the whole time of the Cure may receive and contein the broken Member. *Hippocrat.* (in his *B. de Officin. Medic. Text* 3. and 30.) in giving a right and due Scituation unto the Member, commandeth us to take notice of, and wel to heed these three things, Rest, the Middle or Mean position, and Custom. Rest indeed, that so such a Scituation of the Member may be chosen, as a man is wont to keep at that time when he is most free from all manner of busines, and most addicteth himself to ease and idleness. But the middle Scituation is a posture betwixt extreme distension, and Contraction; and yet nevertheless not alwaies exactly, but such as cometh neerest unto the mean or middle position. As for example; in the Arm, that is to be accounted for the middle Scituation, which doth not Constitute a right Angle in the Elbow, but rather an obtuse and blunt Angle; and such as comes somthing nigh unto a stretching of it forth: like as we see men when they are quiet and idle, they hold not their Arms exactly in a just middle posture betwixt being altogether stretched forth straight, and wholly bowed and bent together; but somwhat more inclining and tending toward a stretching of it forth: which Figure is therefore most pleasing unto them, in regard that it is most free from pain. And then lastly, Custom is also much to be regarded and lookt upon; because that no other habit is so easily born as that unto which we have accustomed our selves. Unto which we may likewise add a fourth, out of the same *Hippocrates*, (in his 1 *B. of Fractures*, and 1 *Text*) to wit, that such a state of the Muscle is to be chosen, under which the broken bones may be drawn divers and several waies, without any great adoe, or offering violence unto them; and such as when the Member is conteined under that habit, it is then free from all pain. He only doth both these, who so Figureth and placeth the Muscles, that their Fibres may be direct, and stretched forth in a straight manner. Now they may be said to be direct, and directly extended, when the whole Muscle is placed in one part of the Member. For if the Muscle that hath its beginning in the interior part be so placed that the Scituation thereof be in the middle from the interior part, and extreme from the exterior; or so, that the Scituation of it be in the midst from the superior part, and extreme from the exterior, by this means it is wrapped together about the Member, and so extended.

Now when the binding is right, and performed as it ought to be, it is known by this; (as

as *Hippocrates* tells us, in his 1 B. of *Fractures*) first of all, by the moan and complaint made by the sick person, when you ask him whether he be pressed too hard by the said binding, and he shall answer, that he is indeed pressed, but lightly, (and so that he can wel endure it) and that especially in the place where the Fracture is. And therefore whosoever he be that hath his Fracture rightly bound up, he must of Necessity confess that these things are so. But when the Patient is abundantly troubled and pained under these swathes, they are then speedily to be loosened, and more fitly to be bound; lest that from the too hard binding dangerous symptoms should happen to arise. But on the other side, if the windings about of the swathes be looser then is meet, and that the Patient shall answer that he feels not the swathing at all, the swathes are then to be drawn somwhat harder; in regard that these bindings if they be over loose, they cannot prevent the Members being depraved in that part where the Fracture is.

There are also other signs of a Moderate binding, and when it is as it ought to be. If the same day and night in which he was bound up with these swathes he seemeth to himself not to be lightly bound, but somewhat hard and streight; and the day following, a soft and small tumor arise in the extremity of the Member. For the smalness of the swelling and softness sheweth that there is somthing pressed forth (by the binding) from the part affected unto the extremity and utmost part of the Member. But if there appear no swelling, it sheweth that the fracture was not bound hard enough: and if the swelling be great and hard (that is, such as wil not readily yield unto the touch) that is present in the extreme or utmost part of the Member, it then giveth us a sure sign and token, that the part affected is too hard swathed and bound up.

And therefore if we find the signs of a due and fit binding up of the fracture, and that there be no considerable pain present, neither any inflammation or exulceration suspected, the rest of the work (which is the producing of a *Callus*, by the which the broken bones are Joyned together) is to be committed to Nature, whose work it is; and the binding not to be loosned before the third day. But on the third day let the swathes be loosened, and again rowled about the fracture, to the end they may both be drawn harder and closer upon the place affected; as also that there may be opened a passage forth for the humors and vapours contained under the skin: which that they may be scattered, and that there may be no itching excited (or if there be any Itching that infesteth the Party) *Hippocrates* wil have the Member to be bathed in warm water (or the water to be poured upon it,) that so the pores may be opened. But if we be slow in the loosening of the binding, there arise from thence oftentimes great inconveniences; to wit, an exulceration of the part, a putridness, and Gangrene, yea and even the hazard and danger of the life. Examples whereof we meet with in *Guilhelm. Frabricius*, in his *second Century*, and 91. *Observat.* And therefore he adviseth us that every second, or at least every third day, the binding be alwaies loosened: and that although after the seventh day there be no such urgent Necessity of the often loosening the fracture, yet Nevertheless his own practise was every fourth day to loosen the swathbands; and (as he writeth) his Custom was to take an exact view of the part affected. And this binding is to be continued until such time as the *Callus* be bred, and the fracture healed; which in the Thigh is wont to be done in fourty days, in the shoulder and Ankle in thirty, in the *Radius* and Elbow in twenty, and in the bones of the Fingers in five days. But yet this time cannot be so easily and precisely determined in all of them (as we told you in the Prognosticks) but it much varyeth according to the Aage, Constitution of body, time of the yeer, and the Nature and Condition of the Fracture it self: for a fracture is much sooner cured in a young person, then in one that is Aged; and sooner in the spring time, then in the summer.

But in the Mean time (While these things are in doing) universal Medicaments are not to be neglected; to wit, the opening of a vein, and purgation, even according as this or that Constitution of the patient shal require. And al these things are to be done for this end, that so the bones may be conglutinated. Now this is done by the benefit of the *Callus*; which whether it be somthing that is heterogeneous, or else in its substance like unto the bones, we have shewn you above, part. 4. *Chapt.* 4. But now the generating and production of the *Callus* (by which the bones are conglutinated and made to grow together) it is the work of Nature: but yet the Physitian may and ought to help and assist Nature in this her operation; and this he may do, if he take care to prevent and keep off inflammations, or the like Accidents that might any way hurt the substance and Temperament of the Member; and that the Aliment it self by drying Medicaments be so disposed, that it may thereby the sooner be changed into a *Callus*. Now this may almost

The generating of the Callus.

wholly be effected by the Medicaments above mentioned; in the place whereof (after a few daies) there are to succeed likewise the *Emplaster Diapalma*, *the Emplastrum Barbarum*, *Oxycroceum*, *the black Emplaster*, and the like.

And furthermore let the Physitian endeavour that there may be a sufficient supply of a matter fit for the breeding of the *Callus*. Unto which end, the Food administred unto the Patient let it be somwhat more plentifully given then formerly; and let it be of a good and somwhat a Tenacious Juyce; such as proceeds from Rice, Wheat, and the like. But because that before the twelfth day there is scarcely ever any *Callus* generated, or that so much as beginneth to breed; and moreover that at first there are many Symptoms to be feared: therefore this ful Dyet is not presently to be allowed of in the very beginning, but a more sparing Dyet is to be observed; yea and (if need require) blood is to be drawn forth by opening a Vein, or purgation to be ordered unto the Patient; and then after this, in the end (as we said before) when the *Callus* beginneth to be generated, a more ful Dyet is to be allowed him.

And there are wont likewise some Medicaments to be administred inwardly, which conduce much unto the more speedy generating and producing of the *Callus*; as the *Pouder* and *Juyce* of *Agrimony Roots*. And very many there are, that commend most highly the *Osteocolla* stone before spoken of; of which beaten smal into a pouder they oftentimes give one dram, with *Comfrey Water*. But in such as are young, and those that are of a good habit, this *Callus* groweth and increaseth too much by this ful Dyet: wherefore it is not to be allowed unto them without much caution; but only unto such as are more stricken in yeers. Touching which thing, as also touching the use of Meats viscid and tenacious (which most Physitians conceive are to be appointed in Fractures) you may read *Guilhelm. Fabricius*, in his 1. *Century*, *Observat.* 90. 91. and 92.

There may likewise be Decoctions prepared, of the *Roots* of *Consound*, (both the *greater* and the *less*) *Dragon-wort*, *Agrimony*, and *Primeroses*. As,

Take *Roots of Consound, and Dragon wort, of each one ounce; Storks bill, one handful; Savine, half a handful; Mace, half an ounce; Zedoary and Galangal, of each two drams; boyl them in Wine in a double vessel: and let the Patient drink twice a day of the straining.*

The same *Fabricius* (in his 3. *Centur.* and 90. *Observat.*) makes use of this Medicament.

Take *the Ossifrage Stone carefully prepared, one ounce; Choice Cinamom, three drams; Sugar, two ounces; Mingle, and beat them into a very fine pouder: give two drams hereof in Flesh broth every day in the morning. And for external Remedies, he commendeth such as these.*

Take *Oyl of Earth-worms, two ounces; Grains of Juniper, two drams; the Juyce of Earth worms, one ounce; Mingle them, and make a Liniment, with which anoint the Fracture.* Or,

Take *Vigo's Emplaster for broken bones, two ounces; Oxycroceum, half an ounce; the Osteocolla stone prepared, one ounce and half; Earth worms prepared, and poudered, one ounce; with as much of the Oyl of Earth worms as will suffice; make an Emplaster, and lay it upon the place affected.*

When the *Callus* that is bred is come unto its Just magnitude, it is then to be confirmed by Medicaments that Corroborate: and therefore such an Emplaster as this is to be laid on.

Take *Oyl of Roses, two ounces; Wax, three ounces and half; the Pouder of Rosin, three ounces; Colophony, Mastick, Frankincense, of each half an ounce; Cypress Nuts, and the Root of Madder, of each one dram; Saffron, half a dram; Mingle them, and make a Cerote; which may be spread upon a Linen Cloth, or a piece of Leather, and so applied.*

The Diet.

And as for matter of Dyet, there ought to be likewise a good and an exact Course, such as before we told you of in Wounds. For if Nature be not offended either by the quantity or the quality of the Food, she will then more rightly discharge her Office and part in the generating of the *Callus*. And indeed some there are who appoint Meats viscid and clammy, of the Feet, Heads, and intestines of some of the Creatures. But we may well fear, lest that from such like Meats as these there may be bred a thick and viscous Chile that may afterwards breed obstructions in the Liver and the Veins, and may infect the whole Mass of Blood; like as *Guilhel. Fabricius* gives us an instance of this very thing, (in his *first Cent.* and 92. *Observation*) in a certain person (a man fourty yeers old) who by the use of such kind of meats fell first into a *Cachexy*, and soon after into a Dropsie, and of this Dropsie he died. And we have sufficiently found by experience, that many sick persons in this Case have without the use of any such Food been perfectly recovered.

CHAP.

Chap. 2. *Of a Fracture with a Wound.*

THe main and chief Difference of a Fracture (and that which very much varieth the Cure) is a Fracture with a Wound. Now this happeneth when the sharp Eminencies or points of the broken bones do perforate the flesh that lieth upon them. Which whensoever it happeneth, the Member is made shorter then it was before: but when the naked and bare bones are restored again unto their proper places, the Member then returneth unto its pristine Longitude. And yet nevertheless somtimes these like fractures happen by some cutting Weapon, when by it not only the flesh, but even the very bone it self is Cut.

But now in these Fractures with a Wound, the bone is somtimes made naked; and somtimes again it is not left altogether bare: and moreover somtimes also we fear the falling out of the bone, or some Fragment thereof; but then somtimes again we fear no such thing.

Prognosticks.

1. But now such like Fractures are yet far more dangerous, if they happen to be with the Flesh and Skin lying over it remaining stil whole and sound. For that perforation exciteth a pain and an Inflammation of the Skin and Flesh; and so the Muscles that are now affected with this Inflammation are forced to suffer a double extension; one that is caused by the Inflammation; the other, that which happeneth unto them from these things that befal them while they are returning unto their former length.

2. But now this danger is so much the greater by how much the parts that are broken and shattered are more noble and principal; as the Muscles, Nerves, Veins, and Arteries.

3. And from hence it is, that a Fracture in the Thigh and Shoulders, with a Wound, and the falling out of a bone, is the most dangerous of all: touching which *Hippocrates* thus, in his *third B. of Fractures, Text* 47. *But they seldom or never escape* (saith he) *whose bones (either of the Arm or Thigh) have fallen outwardly: for as these bones are very great, and very ful of Marrow: so likewise there are besides these many other things wounded that are of very great moment; to wit, the Nerves, Muscles, and Veins; whereupon also it is, that if you put them back, Convulsions are wont to be excited: but then again if you do not put them back into their former places, there will then arise acute and Cholerick Feavers, with a sighing, and a blackness of the place affected. Yet notwithstanding they do not less escape, in whom we neither put them back, nor so much as attempt the doing of it. But furthermore, they also are more likely to escape, who have the lower bone, then those that have their upper bone fallen forth outwardly. And they likewise do somtimes escape with life (but this is very rare) that have these bones replaced and set where they were before.* And in *Text* 41. he saith thus: *And yet notwithstanding a Convulsion is rather produced if these bones be restored unto their places, then if there be no possibility of restoring and replacing them.* And *Celsus* in his 8. *B.* and 10. *Chapt.* saith; *That it is yet somwhat more grievous, when unto the Fracture of a bone there is likewise added a Wound of the flesh, and especially if the Muscles of the Thigh or of the Shoulder be sensible thereof: for these have alwaies the much more grievous Inflammations; and they likewise have Cancers more apt and ready to seize upon them.* Now the danger is much more augmented if the bone fal forth from some domestick (if I may so term it) & interiour part, then if it be from a wild external part; for in the former there are found parts of a far greater account and value. Whereupon it is that *Hippocrates* (in his 3 *B. of Fractures*, and 47. *Text*) writeth; *Neither is it moreover a matter* (saith he) *of little Consequence whether or no the bone break forth unto the exterior part of the Arm or Thigh; in regard that through the interior parts of them there are carried along many and those principal) Veins; of which if any chance to be wounded, and battered together, they Choak and Throttle the party; but the Veins that are conveyed through the Exterior parts, as they are fewer, so they are less considerable.*

4. A Fracture with a Wound, if it be made with some cutting Weapon, is dangerous, if it be a great bone that is cut, such as is that of the Thigh or the Shoulder. For such like bones as these (especially if the incision be direct and straight) will very hardly be brought to grow together again; because that by this cutting Weapon the pores of the bone, through which the Aliment for the breeding of the *Callus* did formerly pass, are in a manner obstructed, and so the *Callus* is the longer ere it be generated. And moreover, in regard that such a Fracture is equal, the broken bones are most difficultly kept from being moved; and so by this the Coalition and growing together of these bones is very much impeded.

The Cure in General.

We have here two Indications given us: the former whereof is, that the bones be

again restored unto their own places, and there exactly Joyned together; and the other is, that the Wound may be healed. The replacing of the bones is here altogether difficult, by reason of the parts that are wounded which without great pain, and fear of a convulsion, cannot be extended. Now the way and means to return these bones unto their places again, is, first of all by extending them sufficiently, but yet without all kind of violence: which if it cannot otherwise sufficiently be done, then we must have ready at hand firm and strong Iron Instruments, (like unto Bars) something different in their bigness one from the other; out of which some one of them that is fit and convenient, in the inferiour part is to be administred unto the lower part of the broken bone, but in the superior part unto the upper part of the said broken bone, (like unto an Iron Sparre or Leaver) and so by this means the broken bones shall be forced and driven again into their proper places: touching which *Hippocrates* (in the 3. *B. of Fractures, Text* 39.) writeth in these words: *If* (saith he) *the bone also that is fallen forth upon another bone leave not any fit place for the Iron Sparre; or if that it be so sharp that it start away from it, we must then with a File hollow the said broken bone, until there be a place made for the Iron Sparre, and that it firmely stick unto it.* And the truth is, all these things are to be done instantly, even the very first day, before any Inflammation to arise. For if this should happen, neither the extension nor such putting back of the bones can be so much as attempted without very great danger. If therefore the Chirurgeon be not sent for even at the very first, and that he come not until there now plainly appear to be present an Inflammation, he ought to deferr the putting back of the bones into their places, until he find the Inflammation over and gone. I my self once on a time was present at the Curing of a certain Peasant, who getting up into a Tree to beat down the Acorns, fel down from it, and brake his Leg neer unto the Ankle, insomuch that the bone sticking out rested it self and lay upon the Ankle bone. And he not having in a readiness a fit and expert Chirurgeon, an Inflammation and *Gangrene* happened, which wasted and consumed almost all the Skin and Flesh about the Ankle. He was then carried into the City, where the *Gangrene* ceasing, the bone standing forth by the Iron Sparre or leaver was lifted up, and restored unto its former place; and then after this all things else that were necessary being performed, the Fracture and Wound were healed.

But if it happen that any smal part of the bone shall so stick out that it cannot easily be put back again into its proper place, but that by reason of its various Fraction one part and portion of the bone be an impediment unto another; and that likewise it be not thought fit to attempt any stronger extension of the soft parts, by reason of the pain and Convulsion that may thence be feared; and that the bones may in their conformation rent and tear those parts that lie neer them, and thereby produce pain; in al these regards *Hippocrates* (in his 3. *B. of Fractures, Text* 4.) adviseth us to cut them off, either with the cutting File, or with the Saw, as it shall be thought most convenient, and as may be done with most opportunity. And so likewise, if any portion of the bone break the Flesh, and excite pains, (so that we cannot so much as attempt the replacing of them without a greater disruption) and excruciating tortures in the highest degree, even in this Case also we ought to cut off the bone. But then withal, lest that what happeneth through necessity in the Artificial operation should be imputed unto the Error of the Physitian, the Patient and the by-standers are to be foretold that that part will be shorter then before. And this likewise *Hippocrates* (in his 3. *B. of Fractures*, and 46. *Text*) admonisheth us of, whiles he saith, *That it is also fit that we know this, that of necessity the Bodies must there be made shorter, where the broken bones are diminished, that is to say, Cured by being cut off.* But now in such Fractures as these that are Joyned together with the Wound of the Skin and Flesh lying upon them, we must look well to it likewise, (before ever we Joyn the bones together, and also after that they are thus Joyned) that nothing at all stick betwixt the broken bones, which may any way hinder the Conglutination: and if any thing be found sticking there, (whether it be some smal part of a bone, or any thing else) it is forthwith to be taken out; but this must not be done with any violence, lest that a pain, Inflammation, or Convulsion should be excited. And therefore if at the first, (even in the very beginning) this cannot be performed without violence and pain, it will be more advisedly done of us to defer it, for Nature her self will at length thrust forth every thing that is Extraneous, and that should not be there; and yet nevertheless we ought to help Nature (al we can) with attracting Medicaments.

The binding how to be ordered.

But now as for the manner how the binding up of such a like Fracture with a Wound ought to be instituted and ordered, in this neither the Ancients, nor yet the more Modern Authors, do agree among themselves:

for

for some of them are wont to binde up the Fracture, as otherwise they did when it was without a Wound; that so the Wound may be likewise covered; and they also loosen this binding every third day: and some there are that rowl about the Swathes in such a manner, that the Wound is not at all comprehended within them, but left naked; so that we may from day to day use all due means for the curing thereof, without any frequent binding up and loosening of the whole Fracture. Others there are that use fewer Swathes, and bind up the Fracture after the usual and ordinary manner: but then others there be that administer broader and more Swathes; that so by the number of the Swathes they may accomplish that which might have been done with fewer when hard and streightly rowled. And some there are that altogether neglect and disregard the splinters; others there be that make great use of them; and of those that make use of them, some apply them a good distance off from the wound; but others apply them even upon the very wound it self; but then in that part that lyeth upon the wound they make a hole, that so the *Pus* may pass forth thereat, and that such Medicaments as are needful may be applyed thorow the same. *Cæsar Magatus* (in his *B. of Wounds, Chapt. 6.*) insisteth stil in his own Method; and here likewise in this case he hath no regard at al unto the wound; and unless there happen to follow here upon any thing else that may force him to do otherwise he deferreth the loosening until the fifteenth day, and sometimes unto the thirtyeth, according as the quality of the fracture, and the Nature of the wound seem to perswade: and look how much the longer time the fracture requireth for the making of it firm and strong, so much the longer doth he defer the loosening. And (as he writeth) the generating of the *Pus* in the wound doth not at all deter him. For (saith he) if it be cured in this manner, there is then a far less quantity thereof generated by reason of the heat of the strengthning Covering; & as for that which is bred without the wound, he writeth that nature expelleth forth this. And that this may be the more easily done, he openeth and maketh slits (over against the wound) thorow al the linen Clothes by certain small cuttings; thorow which the *Sanies* (or thin excrement) that is bred may be driven forth.

Now although that in such operations and handy-works we may oftentimes in divers and different manners attain unto the same desired end; yet notwithstanding both *Hippocrates*, and likewise all the more Skilful and experienced Chirurgeons, take it for a most certain and undoubted truth, that the first binding ought so to be instituted, that the wound may not be left naked and bare; but that it may be comprehended within the swathe. And therefore the swathe is first of al indeed to be cast upon the Wound itself; for if it be otherwise done, the humors wil be pressed forth from the Superior part downward toward the wound, and many dangerous Symptoms are from thence excited. And the danger of thus doing we may see experimentally even in one that is sound and free from any such fracture. For if in any such person you binde any one part both above and beneath, and leave the middle part untouched, then the said middle part by the Humors that are from the adjacent Members forced and pressed unto them, is lifted up into a Tumor; and from the influx of the Humors (as we see) it soon changeth its color. And albeit that in the first binding the Member shall be all of it wrapt up within the Swathes; yet notwithstanding there will not from hence be any cause to fear the least danger; in regard that for the first three daies there floweth forth but very little either of *Pus* or *Sanies*, that is to say, the thick or thin Excrements. But here also even in this kind of binding it is to be observed, that we are to make use of a Swathe that is somwhat broader than ordinary, and then otherwise when there is no Wound present; and that there be indeed a sufficient compression made; it being then to be accounted sufficient, when it can retein and keep together the bones: but yet it must be somwhat less then if there were present no Wound; lest that the wounded part being pressed together, a pain and Inflammation should thence be excited: and the number of the Swathes may compensate the more loose and easie binding and rowling of them; since that it is far more safe to rowl about the Swathes oftner, then any way to hurt the part by Compression.

On the third day the binding is to be loosened; and then it is again to be ordered after the first manner. And then most fitly and conveniently there may be a hole cut through the Emplaster or Cataplasm that is imposed upon the Fracture; yea and in the midst of the very Swathes there is a hole to be left; (and so also in the Splinters, if there shall be any applied) that so there may fitting Medicaments be administred unto the Wound; and that the Wound may also be throughly cleansed and purged, without any loosening of the Fracture. And this way of binding is lively set forth unto us by *Ambrose Parry*, in his 14. *B. Chapt.* 18. and 23. For whereas the broken bones (that are wont to perforate

perforate the Skin) are not alwaies so sharp (as in those Fractures that are made by the Sword) that together with them the flesh is bruised together, and a hole made through it; which when of necessity it must be turned into *Pus*, abundance of the said *Pus* must necessarily be bred; which if it be reteined (as needs it must, if the Wound be wholly bound up) soon becometh sharp, and so excireth an itching and pain, and divers other mischiefs; although that Nature be strong and vigorous; yet nevertheless the generating of abundance of the said *Pus* cannot be avoided; since that all whatsoever is bruised must of necessity be converted into *Pus*.

And although that *Magatus* doth cut and make little slits in all the Linen that he putteth upon the Wound, that so there may be a free and ready passage for the *Pus*; yet notwithstanding all the inconveniences that proceed from the retention of the *Pus* cannot by this means be prevented. For if those Swathes and Linen Clothes shal not be shifted before the fifteenth, and somtimes even the thirtieth day, they must certainly be very much defiled and polluted by the *Pus* and *Sanies*; whereupon in the wounded part an itching, pain, and exulceration may follow. But then on the other side, if the Swathes be still kept whole, and not at all cut, and thereupon to be loosned every third day; it is then to be feared, lest that the *Pus* reteined may in the mean time excite some mischief or other; and also lest that in so many loosenings and new bindings up again the bones may be removed out of their places, and having been well set and joyned together they should again be depraved and disordered: which may easily be avoided, if the binding be but seldom loosened, and the Wound kept open. And yet notwithstanding as often as the Wound is dressed, it may be covered over with a new Swathe, (which may contain both Medicaments and those Coverings they cal *Splenia*) and may defend the Wound from the external Air; and it may be loosened as often as there is any need thereof; but then indeed it must be without any agitation, shaking, or violent moving of the broken Member.

And there must also no Splinters be applied, lest that they too much compress the Wound, and beget a pain and Inflammation. And if any will needs apply them, yet notwithstanding they are not to be put upon the very Wound, but neer unto the same. Yet the truth is, the number of the Swathes may very well supply the use of these *Ferulæ* or Splinters. And these things are thus simply to be performed, if there be neither any bone naked and bare, and that we fear not the impostumating and falling out of any broken piece and fragment of the bone.

Chap. 3. *Of a Fracture with a Wound, in which there is no bone made bare, and yet nevertheless a Cause to fear the falling forth of some fragments of the broken bone.*

It happeneth oftentimes notwithstanding in Fractures with Wounds that there is no bone at all left naked and bare: and yet nevertheless we may have great cause to fear that some broken bone may impostumate and drop forth: and this is done when the bones are made dry and withered, so that they cannot be agglutinated unto the sound bone; or in a Fracture, when they are so separated from the rest of the bone, that they can no more be joyned therewith. For then Nature endeavoureth to thrust forth whatsoever is troublesom and burdensom unto her, and what cannot be united unto the rest of the bones; neither is she at rest until whatsoever offendeth be wholly expelled out of the Body: and this oftentimes she doth at length perform although it be a long time first.

Now this happeneth, when the bones are either corrupted by the *Sanies*, or else when they are altered by the external Air; or else likewise when they are so separated (in a Fracture) from the rest of the bones, that they cannot possibly be any more conjoyned with them.

Signs Diagnostick.

Now what the Signs are of a bone like to be impostumated, and to drop forth, we are told by *Hippocrates* in his 3. *B. of Fractures, Text* 18. The First Sign is this, that there floweth forth a greater abundance of the *Sanies* (or thin Excrement) then could rationally be expected from the greatness and Constitution of the Wound. Secondly, That the Lips of the wound do not meet together; or if they do at any time meet together, yet they soon seem as it were to be broken, and to be stirred up and provoked to excretion; and they become as it were loose and spungy; and there is perceived in the wounded part a certain silent motion. For Nature doth not entirely heal a Wound, when there is somthing remaining within that cannot possibly be agglutinated with the rest. Thirdly, If the bone be left bare of Flesh, it is then altogether

together a Sign of its separation and dropping forth; in regard that then it may be altered and corrupted by the external Air, and that the Veins and Arteries (which convey the Aliment) can no longer run forth unto it. And Fourthly, It is then likewise a Sign that the bones will fal out, if they be broken and shattered into many smal pieces and fragments: for then they cannot all of them be easily Conglutinated.

Prognosticks.

1. It is a Sign of an *Abscession* instantly to follow, if there be good Flesh bred in the sides of the sound bone.

2. But the time in which the bones are wont to recede and fal forth is various, and not at all times alike. For in those of a tender Age, and in the Summer, and if the bone be not very great, it is twenty, thirty, or perhaps fourty daies, ere the bone will be separated and fall forth. But if the bone be any thing great, in one of a ful and ripe Age, and in the Winter time, it is usually threescore daies, yea and sometimes longer, ere it impostumate and drop forth.

The Cure.

If the bone that is like to fal forth be moved out of its place, and that it stick in the very Wound, it is immediatly (as we told you before) to be drawn forth with the *Volsella* or Pincers; if it may indeed be so drawn forth without any pain and violence: but otherwise the whole business is to be committed unto Nature, which by degrees wil at the length separate that which cannot be agglutinated. And yet nevertheless she is to be assisted and holpen by the Physitian; and therefore the binding ought to be instituted in a loose manner, and often unbound, that so the *Pus* and filth may not be deteined, but that it may freely and easily flow forth. And likewise there are no Splinters to be imposed upon that place by which the bone is like to fal forth, lest that by compression they cause pain.

And so also there are Medicaments to be laid upon the Wound, that have in them a power of drawing forth of the Wound the bones and whatsoever is extraneous and no way belonging unto the part affected; and such Medicaments we have above mentioned in the *place alleadged*.

But if there be some great and extraordinary portion of the bone like to drop forth, and this because that the parts of the broken bone cannot be again composed and made to Joyn with the other; (*for whatsoever bones shal refuse to be replaced, we ought to know that these will separate and fal forth; as also those that are naked and bare of Flesh*; as *Hippocrates* writeth (in his *B. of Fractures, Sect.* 3. *Text* 44.) such like wounded parts are to be handled with all gentleness. For by reason of motion and compression there happen many times most vehement pains; the smal parts of the broken bone not rightly placed together pricking the parts that lie neer unto them, these parts being very sensible of pain: whereupon it is that those bindings that in other Fractures are very convenient, in such Fractures as these would excite most vehement pains.

Now *Hippocrates* (as he tels us in his *B. of Fractures, Section* 3. *Text* 21.) that so he might avoid these inconveniences, maketh no use of the Swathe, lest that he should press together the part too much, and lest if the part should at all be lifted up he might excite pain; but having finished the replacing of the bones, (as far as it may be done) and having taken away all those fragments of bones that may be taken away, he then applieth unto the Wound the pitched Cerot, or some other Cerot fit to be put upon bloody Wounds: and then after he hath thus done, because that there is an imminent danger of a fluxion, from the weakness of the part, and from pain, (and likewise that the flux of Humors may be driven back, the part strengthened, & the Fracture made firm and stable) he putteth round about it those coverings we cal *Splenia*, doubled; or the *Plagulæ* of thin Linen; in breadth half as broad as half the Palm of the Hand, and no narrower; but then in length a little shorter then that they should come twice about the wounded Member, but yet something longer then to compass about but once only. For if they should be longer, then of necessity (when the Medicaments are renewed) the Member must be lifted up: and if they were shorter, they could not then sufficiently strengthen and establish the Fracture. Those Linen Clothes being first throughly moystened in sharp or sowr Wine, and so many in number as are necessary, (that so there may be place without them) are so to be applied unto the Member, that their Heads may be drawn by the place affected, not round and Circularly, but a little sloping, so as that from the Contrary part (where they began,) they may be brought together the one to the other, after the similitude of the letter X. and that so they may cut cross one another like unto the aforesaid Letter, by drawing the right Head unto the left part, and the left Head unto the right part. Which *Splenia*, in regard that they are not very long, and may be taken away, that the part may not be lifted up, in this respect they are very convenient. And

instead

instead of the Wine we may likewise very fitly administer other Medicaments also, which are as good for the very same use.

There may likewise notwithstanding be administred a binding which is compleated with once only rowling about; and it may be performed with a Swathe, which is to be folded together with a twice or thrice doubled Linen Cloth, (after the manner of a Cross cloth) and so very dexterously to be sewed together in their sides; and so broad that it may cover the whol Wound.

But now because that binding by which the bones (when they are again set in their places) are so to be kept from starting out of their said places hath not any being or use in this case, therefore those Wooden Coffers, Pipes, or the like engines are to be administred, that they may keep the broken part in its proper place. And yet notwithstanding this is carefully to be heeded, that nothing that is hard be immediatly applied unto the part; but that betwixt the wounded part and those Engines there be interposed some soft *Splenia* coverings, that so there may be no compression made: touching which see *Hippocrates*, in his 3. *B. of Fractures*, and 23. *Text.*

And Lastly, If the extremities or ends of the broken bones break out and stick forth without the Skin, we are then to do our utmost endeavour that they may not be altered and corrupted by the external Air, so that afterward they must of necessity be cut off; and therefore we must labour that they may forthwith be replaced, and covered with their Natural covering the Skin: which in what manner it ought to be performed, we have told you above in the Second Chapter.

Chap. 4. *Of the Preternatural Affects that happen unto Fractures.*

But now, in regard that there are various Preternatural affects that are wont to succeed and follow upon Fractures, (which partly retard the Cure, and partly remain even after the Fracture is cured, and are to be taken away) we shall likewise treat of these. Now there are many of these like affects, as Pain, Inflammation, and a *Gangrene* following upon this, an Itching, an Excoriation, an Exulceration, a depraved Figure of the Member, a *Callus* either greater or less then what Justly it ought to be, an Extenuation of the Member, tenderness, and debility; touching all which we intend now to speak.

Pain.

If there be any pain present, this is altogether to be asswaged and taken away; for otherwise by reason hereof the Humor will flow together unto the part affected, and so an Inflammation and other mischiefs wil be excited. But now that it may the better be taken away, we are to consider from what Cause it proceedeth, and that (if possibly it may be) is instantly to be removed. And therefore we are to be wel advised, whether this pain be from some bone that pricketh, or from the Swathes too hard drawn; or whether it be from the ill Scituation of the Member; or else from the afflux of the Humors.

If the pain arise from a bone that pricketh, (and this is known by the light and gentle handling of the part, and the pricking pain following thereupon) then the Swathes are to be loosened, and the pricking bone is either to be put back into its proper place, or (if it may conveniently be done) taken forth, or cut off. Touching which *Celsus* thus, in his 8. *B.* and 10. *Chapter. A Fracture* (saith he) *doth somtimes vex the Flesh with certain sharp pricks as it were, which being known by the itching and pricking, it will be best to open it, for there is a necessity of cutting off these sharp pricks.*

If the pain arise from the over hard binding of the Swathes; this is found by the swelling that appeareth in the extremity of the part, and the sick person complaineth that he is vehemently pressed. And then the Swathes are forthwith to be loosened, and the binding to be made more easie.

If the pain proceed from an ill Scituation and posture of the Member, the sick person doth easily discover this; and it requireth a change of the Scituation; which ought so to be ordered, that the Patient may now confess himself that he is without pain.

And Lastly, If the pain be from the afflux of the Humors, the way and means of curing it is the very same with that of an Inflammation in its beginning; as we shall by and by shew you.

Inflammation.

For if there be a pain excited from the afflux of the Humors and an Inflammation follow thereupon; we are then to oppose the very first beginning of the Inflammation, in that manner as we told you above, in the first part, and 5. *Chap.* To wit, the Member that is bound up must be loosened, and fomented with the Oyl of Roses, either alone, or mingled with the white of an Egg: or else such a like Cataplasm is to be laid on.

Take

Take *Barley meal, three ounces; the pouder of Marsh-Mallow Roots, and Camomile flowers, of each one ounce and half; Roses, one ounce; boyl them in a sufficient quantity of Water and sowr Wine; and then add Oyl of Roses, three ounces; and make a Cataplasm.* And for the rest, see in the *place alleadged.*

But before the Inflammation be ceased, the part is not to be bound up, or certainly, (at least) not to be hard bound; neither are the Splinters, nor any one of those kind of Engines, to be imposed; unless it be that they may prop up the member, and contain the Medicaments.

Gangrene.

And there happeneth oftentimes likewise unto Fractures (and especially those that are made with a Wound,) a Contusion of the Skin, by reason of the Inflammation following thereupon; which how and in what manner it is to be Cured we have already told you above, in the 2. *Part*, and 19. *Chapter.*

Itching and Excoriation.

But if from the *Sanies* there be caused an Itching in the Wound, as also an Excoriation, and Exulceration, then Water temperatly hot is to be made use of, that the Sanies may be washed away, and that it may be called forth and dissipated: and there may be likewise taken such Water as is moderately salt, which cleanseth more powerfully.

And afterward let the place be anointed with the white Camphorate Unguent, with the Unguent of Roses, of Litharge, of Diapompholyx, and the like: unto which likewise there may be added the Juyce of Plantane, or Nightshade.

Chap. 5. *Of Distorted and ill set Bones.*

And very often likewise it chanceth that after the broken bones are again made to grow together they receive not their former wonted and convenient Figure, but are distorted and writhed; whereupon the motion of the Member is much hindered, and a lameness or halting caused in the Foot; or else in the Arms their laying hold on any thing is hurt. Now this cometh to pass, either from the unkilfulness and neglect of the Chirurgeon who setteth the bones, and bindeth up the Fracture; or else through the inordinate motions of the sick person.

The Cure.

This evil is Cured (if the *Callus* be new and hath not been bred above six moneths, and the sick person of a ripe age, and strong, and the broken bone not very great, and the action of the Member not much hurt) if the *Callus* be again broken, and the bones rightly fitted and set together. Now this breaking of the *Callus* is the more easily done, if the *Callus* be first for some daies fomented with the Decoction of Emollient Herbs, as for instance, the Roots and Leaves of Marsh-Mallows, Mallows, Figs fat and dry: and then let a Cataplasm of the same Roots and Herbs be afterwards laid on, or else an Emollient Emplaster. Or else you may administer some such Emollient Unguent as this that followeth.

Take *Unguent Dialthæa, one ounce and half; Bdellium, Mastick, Turpentine, of each half an ounce; the Marrow of the Legs of Veal, Oyl of sweet Almonds, Camomile, the fat of a Hen, of each six drams; the Mucilage of Linseed, and Fenugreek, of each one ounce; Wax as much as will suffice; and make a soft Unguent.*

The Callus how to be broken.

The *Callus* being sufficiently mollefied, the Member is by the help of two Assistants to be drawn this and that way, and so to be extended: but then let the Chirurgeon put again into its place that which sticketh forth in the place where the Fracture is; and if he be not well able to do it otherwise, he may then on that part upon which the bones do most rest and incline lay a Tile wrapt up in Wooll, and so by binding of it he may force it back again unto its former seat, and there accustom it to abide: or else let him altogether break the bone, which may be done in the aforesaid manner; or else if the Chirurgeon put the broken Member (in which the Callus is) upon his Knee, and then on both sides press down the bone as hard as he can with both his Hands. And then the Heads of the bones are rightly to be fitted together, and a Convenient Cure instituted for this new Fracture.

But if the *Callus* be now already old and of long continuance, and that it be waxen very hard, and that the Patient be weak, or aged, the best course will be (as *Albucasis* adviseth) not to lay Hands at all upon it, by reason of the dangerous Symptoms that are wont to follow thereupon, in this kind of Cure. For it is much better, of two evils to choose the less; and to be content rather to live yet longer (though deformed and lame) for many yeers, then by a cruel Cure to attract dangerous and deadly Symptoms. Yet it is a thing impossible, (if the *Callus* be old and obdurate) to break it; but if any

will needs attempt it, the bone is more likely to be broken in some other place then where the *Callus* is; and so by this means grievous Maladies will ensue unto the sick person; and as for what he desireth, he wil be deceived in his hopes; for the deformity and writhedness of the Member will not hereby be corrected, since that the Crooked *Callus* cannot possibly be amended.

Chap. 6. *Of Correcting the* Callus *that is greater or less then what it ought justly to be.*

AND sometimes also it so happeneth that there is generated a *Callus* less or greater then what it should be. And indeed the *Callus* is generated less then it should justly be, by reason of the scarcity and want of that thick Aliment whereby the bones are nourished, and from which the sayd *Callus* is bred: and this scarcity of the Aliment is either from too spare a Dyet in the Patient, or from the Patients not using of those meats that are most fit for the breeding of the *Callus*; or from the swathes being rowled on too hard and close; or else lastly, because that the Medicaments administred being over astringent have hindered the afflux of the Aliment.

Signs thereof Now the *Callus* when it is less then justly it should be is known by the touch, by which it is discovered to be but small, and the Member is somwhat weak in its motion; and the above mentioned causes went before.

What to be done, for the breeding of a greater Callus. But now that there may be generated a greater *Callus*, we are to allow unto the sick person a full dyet, and meats that breed a thick and viscid Juice; the swathes are likewise to be loosened, and the part to be plyed with warm water untill it appear to be very red. For in this manner there is drawn unto the part affected a greater store of blood, that so there may be supplyed a more plentiful matter for the generating of the *Callus*. There are likewise Medicaments to be imposed, & Dropacisms (as they call them) that are moderately heating and attracting a more plentiful Aliment unto the place affected. There is likewise to be administred one dram of the Stone *Osteocolla* with the *Water of the greater Comfry* (ground smal upon a Marble) *in Ptisan, flesh broth, or Wine*, which hath a singular virtue to generate the *Callus*; as by examples *Guilhelmus Fabricius* proveth in his *First Century*, and *Ninetyeth Observation*.

The Callus bigger then it justly should be But then somtimes (on the contrary) the *Callus* is generated bigger then what justly it should be; which proceedeth from the over-abundant afflux of the Aliment (especially when it is too thick) as also by the giving of the *Osteocolla* Stone hand over head; which although it hath indeed a notable virtue in generating the *Callus*, yet Nevertheless it is more sutable and convenient for aged persons, and such as are of riper years, then for such as are very young. For if it be administred unto these, there is then generated a *Callus* greater then what justly it should be, as by an Example *Guilhelm. Fabricius* teacheth us in the place before alleadged.

Signs thereof. Now this *Callus* is known by the very touch, by which it is easily discovered; as also by the pain which ariseth from the Compression of the Muscles and the Nervous parts; whereupon the part also is rendered unfit for motion, and especially if the fracture be made neer unto the Joynt.

The Callus how it is to be made less. Now the *Callus* if it be over-great is diminished and made less by discussive and digestive Medicaments; as by frictions of *Sal Nitre*, and *Oyl*, and by a perfusion and fomentation made of Salt water, or a decoction of the *Leaves* of *Beets*, *Mallows*, *Pellitory of the wal*, *Sage*, *flowers of Camomile*, *and of Melilote*; or else a Cataplasm made of these is to be layd on.

Or else let the part be anoynted with this Unguent. *Viz.*

Take *Goose fat*, *Bears fat*, *Mans fat*, *of each two ounces*; *Juice of Earth-worms one ounce*; *Ammoniacum a dram*; *and mingle them.*

But yet if the *Callus* be harder then ordinary, then let Emollients be added unto Digestives; and before the application of Cataplasms let the place affected be fomented with some Decoction. As,

Take *Roots of Marshmallows one ounce*, *Roots of white Lilyes and Bryony*, *of each half an ounce*; *Flowers of Marshmallows*, *and Mallows*, *of each one handful*; *Camomil and Melilote*, *of each half a handful*; *Linseed*, *and Fenugreek*, *of each half an ounce*; *boyl them for a fomentation*; *and of the mass make a Cataplasm.*

But let these fomentations be used, not only until the part wax red, and begin to swel; but that also the part may again fal, and become lank and wrinkled.

Let this Dyet be very sparing; neither let him eat much food that yieldeth a thick and clammy Juice.

Guilhelmus

Guilhelmus Fabricius (in his 1 *Century*, and *Obſervat.* 21.) maketh uſe of theſe Medicaments, for one whoſe *Callus* was grown too great, by the uſe of the *Stone Oſteocolla*. Firſt of all he twice a day fomented the *Callus* with the following Emollient Decoction.

Take *the Roots and Leaves of Marſh-Mallows, Bryony, white Lillies, Bears Breech, Flowers of Camomile and Melilote, of each one handful; Common Worm-wood, and Red Roſes, of each one ounce; boyl them in Vinegar one part, and Water four parts; unto the Conſumption of the third part.*

After this he anointed the *Callus* with the following Unguent.

Take *Mans fat, Bears fat, and Gooſe fat, of each two ounces; the Juyce of Earth-worms, and Vinegar of Squils, of each one ounce; Mingle and make an Unguent.*

After the Inunction he applied the following Emplaſter ſpread upon Leather.

Take *the Emplaſter of Frogs with Mercury, and of the Mucilage, of each one ounce; and mingle them.*

In this manner he proceeded for ſix daies, until he ſaw that the *Callus* was not only much mollified, but alſo moſt manifeſtly diminiſhed. And afterwards inſtead of the Plaiſter he fitted unto it a Leaden Plate, and with a Swathe he bound it faſt and firmly upon the *Callus*. And by the uſe of the Remedies, and the bleſſing of God upon them, the *Callus* was ſoftened, Reſolved, Extenuated, and Depreſſed; and the ſick perſon reſtored again unto his former health.

Chap. 7. *Of the Slenderneſs and Weakneſs of the Member.*

AND furthermore it happeneth oftentimes, that after a Fracture the Member remaineth ſlender and weak: which is cauſed either through the ſcarcity of the Aliment, whiles that by the long and various bindings of the Swathes the Veins carrying the Aliment unto the part are ſtreightened, and welnigh cloſed up; or elſe when the ſick perſon hath not food enough allowed him to Eat and Drink: and that likewiſe which maketh very much hereunto is a long continued reſt of the Member, and its Ceſſation from Motion.

And therefore we muſt by all means endeavour, that a more plentiful Aliment may be attracted unto the part. And therefore as much as is fit the Member is to be moved, and reduced unto its wonted and accuſtomed motions; and to be fomented with Decoctions that only attract the Aliment unto the part affected, and do not any waies ſcatter it. And Dropaciſms are here likewiſe of ſingular uſe. Or,

For broken bones that grow not together as formerly.

Take *Oyl of Coſtus and of Camomile, of each half an ounce; Oyl of Caſtor, and the Martiat Unguent, and Mans fat, of each one ounce; and mingle them.*

And ſometimes alſo it happeneth (eſpecially in aged perſons) that the broken bones will not be brought to grow together again; of which thing *Guilhelm. Fabricius* (in his 1 *Cent. Obſervat.* 92.) hath a Hiſtory. The very like whereunto there happened here of late, in a very learned man, who is yet living. This man was in the very ſame caſe with the other mentioned and deſcribed by *Guilhel. Fabricius*. For he can indeed write with his right Hand; but if at any time he deſire to lift up his whole right Arm (which he had broken) either forward or backward, he then needeth the aſſiſtance and ſupport of his left Hand.

Now this cometh to paſs, if the bones (after they be ſet,) be not kept in their places ſteady and unmoved; and this likewiſe was the cauſe of what happened unto that learned perſon we but even now mentioned. For he being very Fleſhy and Corpulent, and his Shoulder that he had broken being not poſſibly to be bound up in a right manner, and hard enough, and he in the night time ſleeping very unquietly, and continually turning himſelf in his bed; and moreover, by reaſon of his extraordinary ſweating in his Shoulder, the Medicaments applied thereto being continually kept ſo wet and moiſt that they could not ſtick cloſe enough to put forth their virtue, the bones could not be conſolidated, nor brought to grow faſt and firm together, but they lay at a certain diſtance one from the other.

But now ſuch Fractures as theſe are afterward very hardly to be cured, (unleſs it be ſo that they are new and of no long ſtanding, in which the uſual way of Curing is to be adminiſtred, and the *Oſteocolla Stone* to be given the Patient, as we have already ſhewn you how, and in what manner; of which very thing we finde an example in *Guilhelmus Fabricius* his *third Cent. Obſervat.* 90.) in regard that a *Callus* is drawn over the extremities of the broken bones, by reaſon of which the bones can no more be brought to grow together. Yet ſome there are that think that ſuch inveterate Fractures as theſe may likewiſe be Cured. And *Cornelius Celſus* (in his 8. *B.* and 10. *Chapt.*) writeth of them, in theſe very words. *If* (ſaith he) *the Fracture* (*to wit, of the bones that grow not well together*) *be inveterate, the Member is then to be ex-*

tended, that it may be something hurt. The bones are with the Hand to be divided one from the other, that by coming together again they may be exasperated; so that if there be any thing fat, it may by this means be taken away, and that it may wholly become new as it were: and yet great care ought here to be had that the Nerves and Muscles be not hurt. And then the Member is to be fomented with Wine in which Pomegranate Rinds have been boyled; and the same is likewise to be laid on mingled with the white of an Egge. The third day it is to be loosened, and fomented with Water in which Vervein hath been boyled. On the fifth day the like is to be done; and Splinters are to be placed round about it. And as for all the rest that is to be done (both before and after) it is the very same that we wrote before. But this way of Curing is very dangerous, and (which *Celsus* himself likewise feareth) by thus doing the Nerves and Muscles may easily be hurt; and thereupon an Inflammation or Convulsion excited.

Chap. 8. *Of the Fracture of the Arm.*

AND thus much (in general) may suffice to have been spoken touching Fractures. But now because that the bones which are broken are various, and in regard that according to the variety of the broken bones the Cure doth something differ, we shal now therefore speak something of Fractures in their species, and particularly. But as for the rest of the differences, in regard that they make very little or nothing at all either for the knowledg or Cure; and that all that may be said of them is conteined in those things which we have hitherto spoken of Fractures in general; we shall therefore pass them over, and shall treat only of those differences that are taken from the subject, and the diversity of those broken bones. And because that very frequently the Arm, Shoulder, Leg, and Thigh, are broken, we shall therefore in the first place speak of them; and afterwards we intend to treat likewise of the Fractures of the rest of the bones.

The Fracture of the Arm:

And indeed as touching the Fracture of the Arm, in regard that the Arm together with the Hand is the Organ or Instrument of laying hold on things, and of many labors, and is likewise exposed unto external injuries, it is wont to be often broken.

Now the Arm, or that part which is from the Shoulder to the Wrist, consisteth of two bones; of which the greater that lieth lowermost is called *Cubitus* or *Ulna*; but the less which lieth above the Elbow is termed *Radius*. Now somtimes both these bones are broken, and somtimes but only one of them.

Prognosticks.

1. The Fracture of the Arm is more easily Cured when but only one of the bones is broken, then when they are both broken; as we told you above, in the *first Chapt.* and *sixth Prognost.*

2. If only one of these Arm-bones be broken, the Cure is more easie; if the upper bone, (or *Radius*) then if the lower bone (or *Cubitus*) be broken; for the upper needeth less extension then the lower: and if the lower, (to wit, the *Cubitus*) be preserved sound, it serveth instead of a *Basis* and prop as it were, to keep the broken bone from being moved out of its place. And Secondly, Because that it is more easie to be set in its place again; unless it be in that part next the Hand. And thirdly, Because that the Elbow bone being kept safe and sound, it is carried more safely in the Scarf or Linen Swathe.

3. But the worst Fracture of all is, if both the bones be broken together. For first of all, they have no prop, nor any thing at all to sustain them. And then again Secondly, They need a greater Extension; since that the Nerves and Muscles are more contracted toward the place from whence they spring; in regard that there is nothing whereby (when they are extended) they may be so kept. And Thirdly, because that the neer neighbouring parts are more hurt.

4. But now the bones of the Arm are for the most part made to grow together within thirty daies; although (as we said before) there may be great difference in the Age, and Nature of the Patients.

The Cure.

Whatsoever things they are that are required unto the Curing of the Fractures of the other parts, they are here likewise necessary. But as for the Extension, there is less need of strength and force when the *Radius* is broken, then when the *Cubitus* or Elbow is broken: but the greatest need of all, when both the bones are broken. And indeed, if both the bones are broken, the Extension that is made ought to be equal; but if only one of the two bones be broken, the greatest and strongest Extension ought to be in that part where the bone is broken. The Extension being made, the broken bone is again to be directed into its proper place, and there set

set fast. The broken bone being thus replaced, the Fracture (as we told you before) is in a convenient manner to be bound up and rowled about with Swathes; and all other things are here to be performed that were before spoken of in the Cure of a Fracture in general; and then at length the Arm is to be fitly placed and Scituated. And indeed (as *Hippocrates* adviseth in his *first B. of Fractures, Text* 22.) in the placing thereof there is great care to be had, that the Hand be not lower then the Elbow; lest that if the Arm hang down the Blood should flow toward the Fracture; but somthing (and not much) higher then the Elbow; and yet nevertheless so that no pain at al may be caused. And the Arm is also to be placed in that Figure, which may not in the least pervert any of the Muscles, and breed pain. And therefore the Arm is neither to be wholly extended, neither ought it to be wholly doubled and bowed together: neither is it likewise to be placed in a Supine or Prone manner. For these are the four extreme habits; and extension is contrary unto bending and crooking; and so is Supine also contrary unto Prone. But now, there are also two other manners; one that betwixt extreme bending and extension (called *Angularis* by *Hippocrates*) the other between prone and supine. And alwaies, if the Arm be rightly placed, the Muscles that arise in the fore part of the Elbow will be wholly Scituated from the interior part; and those that are from the exterior part will likewise be conteined in this; and so there will not be at all any extension or perversion of the Muscles. And indeed, the Arm being thus bound up and Scituated, it will be very fit that the sick person keep himself in his bed for ten daies. But after this, in regard that the sick person will not be willing any longer to keep his bed, but wil now desire to walk about; from the Neck the Arm is to be hung in a broad and soft Garter or Scarf, equally sustaining within it good part of the Arm, with part of the Palm of the Hand, so, that none of the bones that are set and joyned together may by any means be moved out of their places.

Chap. 9 *Of the Fracture of the Shoulder.*

Prognosticks.

The Shoulder bone grows together in fourty daies: for it being somwhat a great bone requireth the longer time for the generating of the *Callus*.

The Cure.

And therefore the first care (as in all Fractures) ought to be, that the broken bones may be restored unto their own places; and being joyned together, that they may be so preserved. That this may be the better performed, there will first of all be need of Extension; which how it ought to be done in this Case, *Hippocrates* hath accurately described in his 2 *B. of Fractures*, and *Offic. Medic.* The Sum of all is this; that the sick person either sitting or lying along be kept so steady and immoveable, that he may not be stirred so as to give ground in the Extension of the part: and let the Shoulder be kept in about the upper part of it, and the broken bone drawn this and that way. Now if this cannot be done (in those that are of ful and ripe age) by the help of the Hands alone (by reason of the thickness and strength of the Muscles in that place) then there wil be need of Engines and Cords; of which *Hippocrates* (in the *place alleadged*) maketh mention. The Extension being performed, the bones are conveniently to be set and placed together; which may here be done without any difficulty. Unto the broken bones set right and straight fit Medicaments (touching which we have spoken before, in the first Chapt.) are to be laid on; and afterward Swathes are to be cast about it, beginning from the Fracture it self: and here we are to be very heedful, that the Member be evermore bound up in that Figure in which it ought to remain; that is, that the Elbow with the Shoulder may make a right Angle, lest that in changing the Scituation the Swathe press too close in one part, & be overloose in another, and so the bones be perverted. *Hippocrates* bindeth on the Splinters the seventh or the nineth day, because that in the Shoulder by reason of the greatness of the Muscles (by which it is conteined) those bones that are about the Fracture in a longer time become altogether slender and loose: for then at the length we come most fitly unto the applying of the Splinters. But we must have a care that these Splinters touch not the extremities of the Joynts; and therefore (as *Celsus* in his 8. *B.* and 10. *Chap.* telleth us) they ought on the outside to be very long, somwhat shorter from the brawn of the Arms, but shortest of all under the wing of the Shoulder. But if the Splinters be instantly fastened on at the very first of all (according to the practise of some, and indeed most of the Modern Artists) they ought then to be tied on but loosely; but then after the seventh and nineth day they are afterward to be loosened, and bound on somthing harder. And then in the

the last place the Member is rightly to be placed; and that the Shoulder may not be perverted and turned awry, let the broad Swathe that encompasseth the Shoulder be drawn in a round manner about the Breast; and when the Shoulder ought to rest, let the first many times wrapped about be cast and drawn under betwixt the side and the Elbow, lest that the Shoulder touch upon the side; but yet let there be a space in the middle, whither when the Shoulder is forced by the Reins drawing it into the breast, it may not at all be depraved and disordered. Let the sick person lie upon his back, putting his hand upon his Stomack; and let soft pillows be put under the Shoulder, that so it may not remain hung up as it were; but the Elbow is to be lifted up by a Scarf put about the Neck, that so the Angular Figure may be preserved, and that it may not be moved whilest the Patient sleepeth.

Chap. 10 *Of the Fracture of the Leg.*

THe Leg is that part that is extended from the Knee unto the Foot. Now it consisteth of two bones: of which that which is the thicker, and is Scituated in the inward part of the Leg, we call *Tibia* or the Shinbone; but the thinner and outward bone is termed *Fibula*. Now these bones are broken, somtimes both of them together, and somtimes but only one of them; and the Fracture happeneth either in the midst, or in the upper, or in the nether part.

Signs Diagnostick.

If both the bones be broken, this is most easily known; because that the whole Leg may then be bowed and bended. And it is likewise no hard matter to know the Fracture of the shinbone, if it be wholly broken; because that this whole bone cometh easily to be seen as being in a place where there is but little or no flesh. But if the *Fibula* only be broken, this is not so easily known, because that it is covered with much flesh; and yet nevertheless the broken part inclineth inwardly.

Prognosticks.

1. If only one of the bones be broken, the Cure is then easier then if they be both broken.

2. If the *Fibula* only be broken, it is more easily Cured; and the sick person will be sooner able to set his Foot to the ground, in regard that the Legs are easily extended; and because that the Shin-bone susteineth the greatest part of the weight of the Body.

3. If the Shin-bone be broken, it is very hardly Cured; because that there is here need of a greater Extension; and the sick person is much longer ere he dare adventure to walk.

4. But now these bones for the most part are consolidated within fourty daies, and very seldom sooner.

The Cure.

And therefore, whether only one, or both the bones be broken, the Leg is (as much as may be) to be extended; that so the bones without any damage at all may again be restored unto their own places, and there joyned together. Which most commonly is to be done by two strong able men; who are to draw the Leg toward them, they standing on both sides of the same; one into the superior part, and the other into the inferior part. And it will be but a Vain-glorious act in them to make use of any kind of Engines, when the Case doth not require it. But if they cannot accomplish it otherwise, let them then make use of the Reins and Engines that we so often have described, and which are so generally well known. And when the Leg shall be sufficiently extended, the broken bones are then to be setled in their places. And afterward convenient Medicaments are to be imposed; and the Leg is then to be rowled and wrapt about with Swathes, (as in general we have already told you;) which ought to be both broader and longer then in the Arm: and the Leg is so altogether to be Scituated and composed, that it may not be turned awry unto any part; and that the broken bones may not be disordered when he goeth to his bed, or to ease Nature. Touching the Scituation of the Shank or Shin-bone, see likewise further hereof in *Guilhelm. Fabricius* his 1. *Centur. Observat.* 93. And at length the Leg when it is extended and stretched forth straight, is to be placed upon a Cushion, or some other soft and plain thing, and so the Splinters and Pipes are then to be administred as in general we told you before, in the *first Chapter*; in which thing we are to observe, that they be not applied upon the extremities of the bones sticking out; or upon that Tendon which tendeth and passeth along from the Leg unto the Foot, and is there knit unto the Heel. For these parts having in them a very exquisite sense will not endure compression; but if they be prest together they are then pained and inflamed.

And there is here also somtimes need of blood-letting, and purging, as in the Fracture of the Arm.

As

As for matter of Dyet, we ought altogether more and longer to extenuate the body of the Patient (as *Hippocrates* commandeth) when the Legg, then when the Arm is broken; by how much that is greater and thicker then this; and becauſe there is alſo a Neceſſity that the body ſhould reſt, and lye ſtill.

Chap. 11. Of the Fracture of the Thigh.

THe Thigh bone of all the bones in the body of man is abſolutely the biggeſt, thickeſt, and longeſt; and this may alſo chance to be broken, either in the midſt, or in the Extremityes thereof, and the places neer adjoyning.

Prognoſticks,

1. Touching the Fracture of the Thigh *Celſus* in his eighth Book and *Chap.* 10. writeth thus: *If the Thigh be broken, it muſt of neceſſity be made ſhorter; becauſe that it never more returneth into its old place. But yet notwithſtanding there is much more weakneſs in the Thigh, where the Negligence of fortune is likewiſe added unto the fracture.* Which opinion of *Celſus* is (according to *Peccetus* in his fourth Book, *Chapt.* 24.) thus to be underſtood by us not that by no means the broken bones may be reſtored unto their wonted ſeat in the Thigh, and there be wel fitted together, that therefore the Thigh bone muſt neceſſarily be ſhorter; but when the part is leſs diſtended then need requireth, and when the bones are not wel and moſt exactly ſet and fitted together: ſince that we ſee from day to day Many who have ſuffered a Fracture of the Thigh (it having been wel faſtned together with Iron inſtruments) have yet walked ſtraight & upright without any lameneſs at al. And the very ſame we are taught by *Avicen*, *Book* 4. *fen.* 5. *tract.* 3. *Chap.* 14. by *Guido* de *Cauliac.* in his 5 *tract. Doct.* 1. *Chap.* 7. by *John de vigo*, in his *ſixth Book and* 14. *Chapt.* by *Andreas*, in his ſecond B. of *Chirurgery, and* 14. *Chapt.* and divers others. But *Guilhelm. Fabricius* (in his 5. *Cent.* and 86. *Obſervation*) writeth that he never ſaw nor knew any that after this kind of Fracture eſcaped without a lameneſs, beſides one young Mayd only, unto whom he adminiſtred a new and peculiar kind of Cure. And this eſpecially happeneth if the Thigh be broken nigh unto the Hip. And of this kind of Fracture the Authors alleadged are to be underſtood: But if the Thigh bone be broken toward the knee or in the midſt, & that there be diligence uſed & care taken in the curing thereof, the fracture may then be healed without any great difficulty, or lameneſs. But that if the ſayd thigh bone be broken toward the Hip, lameneſs for the moſt part followeth, theſe are the cauſes, as *Guilhelmus Fabricius* reckoneth them up. The firſt is this, becauſe that the Thigh bone is not ſtraight, as the ſhin and Arm bones are, but that it is naturally dilated into the external part, as it were into a bow: wherefore if it ſhal chance at any time to be broken it is eaſily bowed and bended toward the inward part: but then toward the external part it bunche th forth as it were into a bow. Secondly, there are preſent the greateſt and ſtrongeſt Nerves and Muſcles from the inward part of the Thigh, which ſo ſoon as the bone is broken they drawing, the ſaid bone (which as we have ſaid was now before naturally bowed) toward their original, (to wit, the place where they have their firſt beginning) do eaſily and in ſuch a manner indeed draw it into a bow, that the extremityes thereof about the Fracture do disjoyn themſelves, and ſtick forth toward the external part. Thirdly, becauſe that it is but one only bone, wherefore it is not ſo eaſily to be detained in its own place, as if it had ſome other bone adjoyned with it, as the ſhin and the Arms have. Fourthly, becauſe that the part is very fleſhy, and the bone ſituated as it were in the midſt of a pillow, experience teacheth us that it can very hardly be kept in its own proper place by the benefit of the ſplinters, and the *Splenia* Coverings; and eſpecially if the Fracture be made obliquely. For thoſe very ſtrong Nerves and Muſcles do again (notwithſtanding that they were from the very firſt rightly ſet and replaced) draw the bones out of their proper places. But yet nevertheleſs, if any one wil follow that Method propounded by *Guilhelm. Frabricius* himſelf, he writeth that it may very eaſily be avoided, that the Leg ſhal not at al become ſhorter, or that any lameneſs follow thereupon.

Whether the Fracture of the Thigh do neceſſarily cauſe lameneſs.

2. The Thigh will at length in fifty days be brought to grow together again, and to be Conſolidated, and not ſooner; in regard that (as I ſayd before) it is the greateſt of all the bones, and therefore requireth the longer time that the *Callus* may be generated, by which it is brought to grow together.

The Cure.

The Thigh bone being broken, if the bones be removed out of their places, there will then be need of a very ſtrong

strong and forcible extension; since that the Muscles that encompass about the Thigh are the greatest of all the rest, so that these strong Muscles (when they are contracted toward the place of their original) may easily overcome and master those bonds by which the Extension is made: which if it should so be, the Leg is thereby rendered shorter; which is altogether a great deformity, and very much inconvenient. For although the Arm be somwhat shorter, yet it may be concealed, neither wil there be any great hurt thereby; but the Thigh if it be made shorter it unavoidably causeth a lameness, and unseemly halting.

There being made a sufficient extension, the Muscles (being of all other the strongest) do easily draw up the lower part of the broken bone unto the upper parts. But now nevertheless that this may the more rightly and decently be done, (a sufficient extension being made by the parts of the Palms sticking forth, as in al other Fractures) let the bone be set directly straight, and so pressed close together. And afterward, let a Necessary and fit Medicament be imposed thereon, and the Fracture conveniently be bound up: and here it wil not be amiss to cut in pieces some linen Clothes, and to wrap them round about upon the Hip, and neer the *Ilia* Guts, as likewise the Groins, and that which is betwixt the Arse and the Genitalls; as for other Causes, so likewise more especially for this, to wit, that the external Splinters offend not the naked part.

The Pipe of what kind it must be.

The Pipe that is fitted unto the Thigh ought either to take in the whole Thigh, or else not at al by any means to be administred. For if the Pipe that is fitted thereto be any whit shorter then that it reach even unto the Ham, and beyond it, it will bring more hurt then help thereunto: for it cannot be prevented, but that upon the motion of the body, or the Legg, the Thigh also must be moved. The Pipe will also be very troublesome unto the Ham, and it will suffer the Knee to be bowed. And therefore if any bend the Knee, there is a Necessity that the Thigh bands be likewise therewithal moved, and the Muscles figured in this and that manner, and the broken bones moved out of their places. And therefore it seemeth to be the most expedient course, that the Thigh be al of it conveyed into the sayd *Canalis* or Pipe, which is to reach from the Hip even almost as low as the Foot. But now this Pipe is at a fitting distance to be bound on with many bands both unto the Thigh and Legg; and on both sides woollen Clothes are to be applyed, that so the Member may not decline unto either part; and this is altogether to be done, that so the whole foot, (to wit, the Thigh with the Legg and foot) may lye along softly and without pain; but yet so firmly, that the sick person may not either through impatience, or whilest he sleepeth, move the same.

For it is to be observed, (as well in the Fracture of the Thigh as of the Legg) that the bottom of the heel be kept in as much as may be, and rightly placed: for if the foot hang down, and the rest of the Legg be supported and propped up, there is a Necessity then that the bones should be seen to stick out in the fore-part of the foot: but if the Heel be placed higher then what is Just & fitting (the rest of the Body being gently lifted up,) the bone in the fore part of the Legg will necessarily shew it self more flat then what is Just and meet; and this so much the more, if the Mans heel be naturally greater then ordinary.

And this is likewise (in the Fracture of the Thigh and Legg) to be taken notice of, that if by reason of the swathes, or the binding on too hard of the splinters, or else from any other cause, there arise in the Ham, or the parts beneath it, a swelling greater then what might Justly be expected; then that which is too streight and close, & presseth the part too much, is to be loosned; but the swoln part is to be fomented or anoynted with those things that have in them a virtue of asswaging pain, as also of digesting and gently driving back the humor; such as the moist and oyly wool, throughly wet in wine and oyl; or the like Medicaments.

But yet Nevertheless, (as already hath been sayd) in regard that although this cure should in this manner be accomplished, lameness and halting doth for the most part follow thereupon; therefore *Guilhelm. Fabricius* (in the place alleadged) propoundeth a new and artificial way and Method of Curing the Fractures of the Thigh, declaring it by an example; and withal he writeth that he had reduced the way of curing the Fracture of the Thigh (which hath alwaies hitherto been accounted most difficult) unto that facility, that even any Novice or young Practitioner may without any hesitation or doubting cure such a like Fracture, if he wil but use a little diligence, and be but provided of fit Instruments. But now as for that way and Method of Curing (together with the Instruments described and delineated to the life, we refer you for a sight of them unto the place alleadged.

CHAP.

Chap. 12. *Of the Fracture of the Nose.*

AND theſe bones, to wit, of the Legg, Thigh, Arm, and ſhoulder, are thoſe that are more frequently broken then any other. But yet nevertheleſs it ſo happeneth ſomtimes, that other bones may alſo be broken; touching all which we ſhall now proceed (in our progreſs) orderly to treat of them all, even from the Head unto the foot.

The Fracture of the Noſe

And firſt of all, as touching the Fracture of the Noſe; this may happen many ways, as *Hippocrates* teacheth us, in his Second Book of the Joynts, and 37. *Text.* For either a part of it may be broken off, and yet notwithſtanding the Noſe it ſelf is ſtil kept that it neither hang downward, neither be turned and made to ſtand awry, or that either of theſe ſhould happen; and this either in that part that is Griſtly, and ſticketh forth; or elſe in the reſt of it which is kept and held together with bones. And ſomtimes alſo even in the very midſt of the Noſe (where it is ſharp) the fleſh neer unto the bone is bruiſed and battered, or the bone is likewiſe ſomwhat hurt, but yet not much: and now and then alſo a wound happeneth unto the Fracture.

Prognoſticks.

1. The Noſe of all the parts of the body is moſt eaſily ſet together again: and if it be not forthwith ſet right and ſtraight, it will not at all be ſet right and ſtraight, but that it will ſtand awry.

2. In the Noſethrills a *Callus* is ſoon bred, and increaſed; for the Noſe (unleſs it be corrupted) is in ten days healed, as *Hippocrates* tells us in his ſecond Book of the Joynts. But others notwithſtanding there are that ſay it is not to be done in leſs then eighteen days; and others aſſert, that it is not done in leſs then twenty dayes time: which difference happeneth according to the ſeveral conſtitutions of bodyes. For Nature differeth from Nature.

The Cure.

If therefore the broken Noſe be equally beaten down unto the inferior part, and be rendered flat; then ſomething is to be put into the Noſethrils that may ſet it up ſtraight again, as the Probe or ſearching inſtrument, or the inſtrument they call *Spatha*: or elſe that which is broken is to be lifted up with the finger thruſt up into the Noſethrils, and ſo to be reſtored unto its Natural ſituation, and place. And outwardly likewiſe we ought on both ſides to lay hold on the Noſe, and to draw it upward.

But then, that the bones of the Noſethrils (that are again brought unto their wonted form and figure) may be preſerved in their Natural ſeat, either Liniments folded together, or the ſhavings of Linen (commonly called Lint) or elſe ſome ſuch like thing wrapt up in the Linen, or Leather, or a leaden or ſilver pipe covered over with a ſoft skin, are to be put up into the Noſethrills. But if the noſe be broken only in one ſide of it we ought then alſo to ſet it right & ſtraight (in a Convenient manner) from that part which declineth, and ſo to reſtore it unto its natural ſeat; both by thruſting in the finger, or ſome fit Inſtrument, into the Noſethrills (in that place where the Noſe is hurt; as alſo by ſetting the Noſe ſtraight outwardly. But then, leſt that bone which is compoſed and ſet together again in its due place ſhould again be depraved, and fall down; there are to be thruſt up into the Noſethril that is hurt either Linen raggs, or a great Gooſequill anoynted with a Gum, and covered over with a ſoft skin, or a pipe or plummet of Lead, or little ſtaff of ſilver, wrapped up in a ſoft Skin. Neither is it much material what it is we thruſt up into the Noſethrills; only that it be ſomthing that may keep the broken bone of the Noſe from falling down; and that it be ſomewhat that is ſoft, and free from an offenſive ſmell. Neither are ſpunges alſo (or the like things) to be put up into the Noſethrills, in regard that by ſoaking in the Moiſture of the Noſe they become thick, and are dilated; and ſo being dilated they diſtend the part, and again move out of their places the bones after they have been wel ſet together. That which is put up ought to be anoynted with ſome emplaſtick Medicament, of *Mannathuris* or the *fine flour of Frankincenſe, Gum Tragacanth, Maſtick and oyl of Roſes.*

But if the Noſe be broken, and writhed in an oblique manner neer unto the Griſtle, then we muſt agglutinate unto the Noſe (in that part into which it inclineth) a little loop or fillet (of a fingers bredth) with that kind of Glew which we mentioned before, touching the dry future or ſtretching in Wounds; and afterward it is to be ſtretched forth, as much as ſhall be thought fit, that ſo the Noſe may be ſet ſtraight again. But let this fillet be ſo long, that it may afterward being drawn below the Ear be drawn likewiſe about the Head: and as for the two ends thereof, we may agglutinate them unto the forehead. For this Rein will juſtly ſet ſtraight the Noſe, and it may be either ſtreyned or ſlack-

ned, according as we find occasion. And if the Tents that are put up into the Nosethrils do stir up and cause any pain, they are to be taken from thence; and all this while the Nosethrils are to be kept straight with the Reins aforesaid. But after the fourteenth day the Reins are to be removed, and a Cerot to be laid on, and care taken that the *Callus* do not grow forth more then what is just and fit.

If the bones of the Nose shall be broken and shattered into smal pieces; we are then (as much as may be) to put them all, and each particular of them, back into its proper seat; or else they are to be driven back by Instruments fit for that purpose; neither must we easily admit of the taking forth of any bone, and not at all, if it may by any means be agglutinated, in regard that it breedeth deformity. And afterward some Cerot or some other Medicament is to be imposed, for the confirming and strengthening of the bones.

If a Wound shal happen with the Fracture, then some Emplaster that is fit and convenient in bloody Wounds is to be laid on: and such like Wounds are most easily Cured of any.

If any Ulcer begin to breed within the Nosethrils; then tents anoynted with fit and proper Medicaments are to be put up into them; and by all means care must be taken that there grow forth no flesh within the Nosethrils. For which end likewise very useful is the Leaden Pipe put up.

The binding up of Fractures.

Touching the binding up of these Fractures Authors differ much; and of these, some of them allow of these bindings up, but others altogether disapprove of them. And indeed it seemeth altogether more safe wholly to omit these bindings up, and the Swathes; seeing that either they perform nothing at all, if they be loose; or if they be harder and closer drawn together, they then set the Nose awry, and make it flat; and very easily may the broken bones of the Nose be kept fast in their places by convenient Emplasters, without any binding up at all. And in no other case doth this binding seem convenient, but only in this, if in the middle of the Nose (where it is sharp) the flesh be brussed about the bone, and the bone stick forth; that so the Nose being pressed together in that part may acquire its own Natural Figure again. But here also, as for binding, although it seem altogether necessary, and very profitable: yet nevertheless we deny it to be at all necessary, since that a Cerot or an Emplaster may suffice. And if at al it be requisite to apply the Swathe, it is to be cast upon the middle of the Nose, and both the ends thereof are to be tied together at the hinder part of the Head.

Ambrose Parry useth this:

Take *Frankincense, Mastick, Bole-Armoniack, and Dragons blood, of each half an ounce; Roch Alum, and Rosin of the Pine, of each two drams. Let them be very finely poudered, and then incorporated with the white of an Egg.* See more hereof in *Hippocrates* his 2. *B.* of the *Joynts*, from the 36. to the 46. *Text.*

Chap. 13. *Of the Fracture of the Jaw Bone.*

AND sometimes also the lower Jaw is broken; and this is very easily to be known.

Prognosticks.

1. If the bones of the Jaw have not an Inflammation happening unto them, even from the very beginning, they are then consolidated within twenty daies, and the Teeth remain entire and safe.

2. But if the Cure be long delaied, the Teeth may be vitiated, and rendered unuseful.

The Cure.

If the Jaw Bone be so broken transversly, that yet notwithstanding the bones stick together one to the other in any part, we ought with the Fingers on both sides (to wit, as wel those that are put up into the Mouth, as those that are outwardly applied) to press the bone together, and so to force it into its own seat again. But that the Jaw Bone is again restored into its own place, appeareth by the equality and evenness of it, and of the Teeth.

But if the whole Jaw bone be broken in a transverse manner (which nevertheless very seldom happeneth) and so that indeed bone stick out upon bone, and that one Tooth stand out upon the next Tooth unto it, then by putting the Fingers into the Mouth, and likewise by applying the Hand externally, the broken bones are to be set in their places again: and unless it may be done by a single & simple compression, there ought first of al an extension to be made (the Physitian extending it before, and some assistant that helpeth him keeping of it back) and afterward the bones ought to be set and Joyned together. It is a sign that the Jaw bone is rightly set and replaced, if we see that the Teeth are

again

again restored and disposed of unto their former Natural Situation.

The Teeth which have been moved and loosned in their holes are with a Thread of Gold, Silver, or Iron, to be Joyned and fastned unto those that stand next them; until they shall again become firm and stable in their places.

These things being thus performed, some Medicament that is fit and proper for the Fracture is outwardly to be applied unto the Jaw bone, that so the broken bones being now set together again may be firmly fastned in their seats; and externally we are to apply a Splinter of Leather or some other convenient matter, answering in length unto the Jaw bone. And after this a fit convenient binding is to be instituted; which is done with a Swathe slit at both ends, two Fingers broad, and in the middle part of it cut also long waies, that it may on both sides take in, and contain the Chin. And therefore there being four Heads of the Swathe thus slit at both ends, the two lower of them are to be brought and drawn along unto the top of the Head, and there to be tied together or sewed unto the sick persons night Cap; but the two uppermost are transversly to be drawn unto the lowest part of the Head behind; or else to be sewed likewise unto the same night Cap.

Let not the sick person lie upon the broken Jaw-bone, but upon that Jaw-bone that is sound and unbroken; and yet nevertheless let him not rest himself thereon, but rather upon his Head, lest that the Jaw-bone that is set in its place be again distorted and made to stand awry. Let the Jaw likewise be kept immoveable; and therefore let not the Patient speak much, neither chew hard Meats, but let him be nourished with Food that is soft and moist, until the *Callus* be hardened. If any thing shall be observed to be again removed out of its place, on the third day the binding is to be loosened; and if any thing be fallen out, it is again to be replaced.

Chap. 14 *Of the Fracture of the Channel bone, or the Bone of the Throat.*

Hippocrates (in his *B. of the Joynts*, Text 62.) reckoneth up six Differences of the Fracture of the Channel bone. For either this bone is broken in a transverse manner, or else long waies. If transversly, this happeneth either neer unto the Joynt of the Shoulder; or else it is broken more toward the breast bone; and furthermore, the Throat bone is either so broken, that that part which is from the breast is carried upward; but that part which is from the top of the broad bone of the Shoulder is carried downward; and this very often (and for the most part) happeneth: or else on the contrary, that part nigh unto the Shoulder blade is carried upwards; but that which is neer unto the Breast is carried downward; and this very rarely happeneth.

Signs Diagnostick.

Now this Fracture of the Channel bone is known rather by the touch, then by the sight; as also by the pain.

Prognosticks.

1. If the Channel bone be broken transversly, it is the more easily Cured; if long waies, it is the harder to be Cured. For that which is transversly broken may easily (by extension, and the compression of the Fingers) be brought to return unto its Natural seat; but the other Fracture (that is in the length of the bone) hath evermore somthing that sticketh out, which can very hardly be fitted together. And then again, because that the Throat bone cannot be so wrapped round about with the Swathe, that what is cleft and broken in the length of the Bone may be again compelled into its own seat; but on the contrary, that which is broken transversly is more easily by the Ligature to be forced back into its own seat again.

2. The Fracture of the Throat doth indeed nothing at all hurt the Commissure of the Shoulder, or any other part: and yet nevertheless because that (although the utmost diligence shall be used) the Neck and the Throat cannot (as the Arms and the Legs) be closely wrapped about with the Swathe, the *Callus* therefore leaveth a very great deformity; because that in a thin bone the *Callus* doth easily become greater: but it is only in the beginning that it seemeth deformed, while it is yet new; but in process of time, when we are once accustomed thereunto, the deformity seemeth the less.

3. But the Throat-bone doth easily grow together again, like as do other thin bones; and indeed in twenty daies at the very utmost it is Ferruminated.

The Cure.

But now that this Fracture may be Cured, there are necessarily required two able assistants, for the extension of this Fracture; of which, let the one with both Hands draw back unto the hinder part the Shoulder that lieth neer unto the broken Channel bone;

and let the other quite contrary draw rather toward him the opposite Shoulder, or the opposite part of the Neck; that so the extension may be made. Which so soon as it is done, let the Chirurgeon with his Fingers restore the broken bones unto their places again, by pressing together with his Fingers that which sticketh up too high, and by lifting up that which is pressed down; or by restoring it back again into its Natural seat, in any manner whatsoever that shall be thought needful. Some there are, who to Facilitate the restitution of the bone, do put something that is round under the Arm-pit of the sick person, that it may fill up the Cavity thereof; and then withal they greatly press the Elbow unto the Ribs; and so by this means they again restore the bone unto its own place. But if the extremities of the broken bone be so depressed that they cannot in this manner be brought back again upward, then the sick person is again to be laid flat upon his Back upon a hard Pillow or Cushion put under his back-bone between the Shoulder-blades; but the Shoulders are by the strength of the Hands lying upon them so to be pressed down, that the extremities of the broken bone that are depressed may be lifted up so high, that they may again berestored unto their own Natural Scituation.

But if the Channel bone be broken and shattered into many smal pieces, and that some fragment thereof cause a pricking in the flesh, and difficulty of breathing; then there is an incision to be made in that part of the flesh, and the fragments to be taken forth; or the sharp pricks are to be cut and shaved off; and the bones when they are made plain must be joyned together; the Lips of the Wound are likewise to be drawn close together, and some Medicament proper for the Fracture (and which may withall resist and hinder Inflammation) is to be laid on. But if there be found to be many fragments of the bone, (the Skin remaining entire and sound) that yet are not sharp, neither do at all prick, then a Splinter is to be provided of Leather, or some other convenient matter, and being anoynted with a fit Medicament it is to be applied unto those fragments.

The broken Channel bones being rightly set together, some Medicament fit and proper for the Fracture (such as are above propounded in the *first Chapter*) is to be imposed. After this three Coverings of a convenient thickness and length (so that they may fil up the Cavity or hollowness both above and beneath the Channel bone) are to be provided; of the which two of them are to be put upon the sides; but the third that is thicker is to be imposed upon the Fracture sticking forth. For so by this means both the broken bone that sticketh out will be depressed, and the broken bones so kept in, that they shall not be moved either upward or downward; neither shall these broken bones (being once set together) be removed out of their proper places unto the sides. And after this a right binding up is to be instituted, which may be done with a Swathe as broad as the Palm of the Hand (or four Fingers breadth) of a sufficient length, having a double Head; it is to be made Cross wise, in the form of the Letter X; which is rather to be often drawn about the place of the Fracture, then that the said Fracture should be too close and hard bound; and it is so to be rowled about, that it may draw the Arm unto the hinder parts. And the Cavity also under the Arm-pit neer unto the part affected is to be filled up with Linen Clothes folded together. For so the sick party will the better and more easily endure the binding. The sick person must also be ordered to take his rest, and to keep himself as quiet as he can; and he himself is to bend back his Arm toward the hinder parts. But let not the Swathe be loosened before the seventh day, unless an Itching, or some urgent Cause require it: and if it be from day to day to be loosened, it may likewise be daily drawn a little closer and harder together.

Chap. 15 *Of the Fracture of the Shoulder-blade.*

THe Shoulder-blade (by the Greeks called *Omoplata*, but by the Latines *Scapula*, or that Triangular bone, neer unto the *Vertebræ* of the hinder part of the Neck, and adhering unto the Back and Breast, not by any Articulation or Joynting, but only by the intervention of the Muscles, and before Joyned together by Articulation with the fore part of the Shoulder and the Throat; touching which see more in the Anatomists) may be broken in any part of it; but yet notwithstanding more rarely in that process that is termed *Acromion*; but oftentimes in the part that is nigh unto the *Spina* or Back bone; and in all other its Extremities.

Signs Diagnostick.

If the *Acromion* be broken, this is perceived both by the sight and touch, and a certain unevenness is likewise easily to be discovered; especially if we compare together the found and unfound part. If a broader part thereof, or any part in its extremities be

be broken, then there is by the touch discovered a certain Cavity; and there is perceived likewise a pricking pain in the part; but a kind of stupidity and benummedness seizeth upon the Arm stretched directly forth.

Prognosticks.

1. The Fracture that is in the top of the Shoulder or the *Acromion* is more difficultly Cured, then in any other parts of the Shoulder-blade.

2. If the Fracture be in the Neck of the Shoulder-blade, or in the dearticulation of the Shoulder, it is then hardly ever to be healed. For in regard that neer about this Joynt there are the Veins, and Arteries of the Arm-pits, and the Nerves arising from the *Vertebræ* of the Neck behinde, an Inflammation and most grievous Symptoms do happen.

3. The Shoulder-blade bone broken is usually consolidated within twenty four daies.

The Cure.

If the broken bone adhere still unto the Shoulder-blade, it is then by the Chirurgeons Hand to be restored back again into its proper place. But if this may not easily be done, and that there be need of more force and strength, then a bal of Linen may be put under the Arm-pit, and let the assistant draw the shoulder downward, by drawing about the Elbow unto the Ribs; but let the Chirurgeon himself with his Hand press down the Fracture, and set the bone that is broken. But if the broken bone do not cohere with the Shoulder blade, but that it only yet hangeth thereunto by the Ligaments and the *Periostium*, and that it exciteth no great danger by pricking, it is then also to be restored even unto its own place again. But if the broken bones be altogether separated both from the Shoulder blade, and from the *Periostium* also, and the Ligaments, and prick the flesh, the Skin and the Flesh ought then to be cut, and the fragments to be taken forth. But if they prick not, they are then to be left remayning. For Nature at length expelleth of her own accord that which cohereth not with the rest; although it be sometimes long ere this be done; like as *Ambrose Parry* (in his 14 *B* and 9. *Chapt.*) relateth, that a certain Marquess had after seven yeers time certain fragments of bones breaking out of his wounded Shoulder-blade, the Cicatrice being opened. The bones being rightly set in their places, fit Medicaments are to be imposed upon the Fracture, and a Convenient binding is to be instituted; and if the top of the Shoulder be broken, a Linen ball is then to be bound under the Wing thereof; and the binding is not to be loosened before the seventh day, unless there happen something else. Let the sick person lie on the opposite side; and let him (all he can) keep the part in quietness.

Chap. 16 *Of the Fracture of the* Sternum, *or* Breast-bone.

THe *Sternum* (or Breast bone) it self is sometimes broken, either by a fal, or by a blow.

Signs Diagnostick

Which is known from the pain, and especially, from the inequality, which is discovered by the touch; and at the compression of the Fingers the broken bone retireth inwardly; and there is a certain sound or noise heard; and there where the bone is broken, there may be notice taken of a Cavity. And there is also difficulty of breathing, the Cough, and spitting of Blood, that for the most part follow thereupon.

Prognosticks.

1. The Fracture of the *Stern* is very dangerous; in regard that by reason of the *Pleura* Membrane, (which is easily hurt together with the *Stern*) and the noble parts that lie under it, it is wont to attract sad and grievous Evils.

2. But yet it is consolidated in twenty, or twenty four daies, in regard that it is spungy and thin

The Cure.

Now that this bone when it is broken and depressed may be restored again unto its own seat, the sick person being laid flat upon his Back, a Pillow is to be put under the *Spina* or Back bone, over against the Fracture; and by some Servant of the Chirurgeon the Shoulder is on both sides to be pressed down; but let the Chirurgeon himself with his Hand press together the Ribbs on both sides, and so let him bring back the broken bones into their places. And after this, those Medicaments that are wont to be administred in other Fractures (and which prevent inflammation, and serve for the Conglutination of the Fracture) are to be imposed; and the binding is to be instituted with fit Swathes above the Shoulders, in the Cross Figure of the letter X; and this binding must not be over hard, left it hinder the breathing.

CHAP.

Chap. 17. Of the Fracture of the Ribbs.

And sometimes also the Ribbs are broken from violent causes, as a fall, a blow, or the like.

But now the Ribbs are sometimes so cleft (as *Celsus* writeth in his 8 *B.* and *Chapt.* 9.) that indeed not the top of the bone, but the inward part thereof, (which is thin) may be hurt; and sometimes so that this fal hath wholly broken them. And indeed the broken bones do sometimes decline inwardly; and sometimes they stick forth outwardly: and sometimes notwithstanding that they are wholly broken, yet they are not moved out of their proper places; and sometimes likewise the flesh about the Ribbs is battered and bruised.

Signs Diagnostick.

If the Whole Ribb be not broken, then neither is there any blood spit forth, neither any fever following thereupon, nor any thing suppurated, (or but very rarely) neither is there present any great pain: and yet nevertheless this place is lightly pained even upon the very touch.

But if the Ribb be wholly broken, and yet the broken extremityes thereof not moved out of their places, by being either driven inwardly, or forced into the Exterior part, there are but very few that are hereupon taken with a fever. And many there are also that do not at all spit blood; neither is there any *Pus* contracted in the Chests of some, and those indeed not a few.

But if the Ribb be both wholly broken, and the extremities thereof moved out of their places, there is then a certain inequality or unevenness, and Cavity, that may be both discovered by the sight, as also by the touch; and there is likewise a certain ratling noyse heard: unto which also there are divers other symptoms Joyned. There is present a very great and grievous pain, and especially if the internal part of the Ribb be broken; (and this pain much resembleth the pain of such as have the Pleurisy) the breathing is very difficult, the Cough extremely troublesom; and now and then likewise spitting of blood followeth thereupon (the Lungs soaking in the blood flowing forth of the broken vessells) and a feaver is also herewithall Joyned, and accompanyeth the same. But more especially two evills there are that usually attend the Fracture of the Ribbs. The first whereof is, the puffing up of the flesh lying upon the Ribb; which is discovered both by the touch and sight; and if the place be pressed together with the hand, there is heard a certain noyse and sound of the Air going forth thereof. Unto which unless timely Remedies be administred, (in the second place) an Inflammation, and a fever, and an Impostume are wont to succeed. The cause of which thing is the separation of the flesh from the bone, and a weakness brought upon the part with the blow, which cannot therefore sufficiently concoct the Aliment, that by reason of the pain is more abundantly attracted, and flowerh thereunto: which remayneth thereupon partly crude and is partly resolved into vapours and flatulencies or windiness. And somtimes the Corruption of the Ribbs is wont likewise to follow this Malady. For when the flesh is separated from the bone, the Air getteth in in the place thereof; by the contact and impression whereof the bone is offended and corrupted.

Prognosticks.

1. If the Fracture be single, without any Contusion or bruising of the parts lying neer thereunto, there is then little or no danger at all: and the Ribbs will grow together again within twenty days.

2. But if the flesh about the Ribbs be battered and bruised, then the evil is very dangerous (by reason of those symptoms that as we have before told you do happen herupon) & somtimes deadly. Touching which *Hippocrates*; (in his 3. *B. of the Joynts, Text.* 65.) *if the Contusion* (*sayth he*) *or the bruising that is caused about the Ribbs be neglected, although upon this a worse Mischief doth not follow, yet notwithstanding it hath the flesh more soft and spungy in the bruised place then it was before: and where such flesh is so left, and not by curing thereof restored unto a good habit, the thing is so much the worse, if filth and snottiness be left about the bone it self; in regard that the flesh wil now no more fasten unto the bone in like manner as formerly; and in regard that the bone it self is rendered more apt and ready for diseases: and for this very cause many have their bones vitiated, because that the evil is a long while protracted, ere it can be Cured.*

3. And thirdly likewise, the Fracture is ful of danger if the Ribb be driven inward and there prick or wound the *Pleura* Membrane; and then almost al those symptoms that are wont to infest those that have a pleurisy do follow upon the sayd fracture; and the Cure is scarcely ever perfectly accomplished in less then fourty days.

The

The Cure.

If the whole Ribb be not broken, (or if wholly broken, yet not removed out of its proper place,) and that there be no Contusion of the parts incumbent and lying neer, then some gentle Medicament that is fit and Convenient for a fracture and inflammations, is to be layd on, of *Frankincense, fine flour Bole Armenick, the White of an Egge,* and the like.

But if the broken Ribb stick forth outwardly it is to be pressed together with the hand, and to be reduced unto its Natural situation: and here also a Convenient Medicament is to be imposed.

But if the broken Ribb tend inwardly, we must endeavor that it may be brought back into its own place. And therefore we must first of all see whether by the Cough, and the holding of the breath, or by the help of the hands the broken Ribb may be restored again into its own place: which if it succeed not, then we must lay on some Emplaster that will attract, and that will stick fast unto the Ribb; and then this Emplaster is again with violence to be taken away, that so the Ribb may be brought back again into its own place.

And very Convenient for this use is this Emplaster also.

Take *The finest wheat flour two ounces; Tragacanth, & Frankincense powdered, of each five drams; Mißleto of the Oake, (to wit, the Glew) six drams; Ichthyocolla or Fish Glue one ounce and half; Whites of Eggs two ounces; Rose-water as much as will suffice; and mingle them.*

Or an Emplaster made of *Turpentine, Rosin, black pitch, Barly Meal, or Beanmeal, Mastick, and Aloes.* And such like emplasters as these are often to be applyed, and then to be taken off when the sick person shall breathe more freely. And I my self remember likewise that some yeers since a certain Cooper having a Ribb broken and depressed in his right side by the violent recoyling of a hoop, which he was bending to make a hoop for a Hogshead, or tub, (so that he could very hardly draw his breath) Coughed extremly, and was not able to lift himself up straight. I applyed and layd on such an Emplaster as this that we have mentioned, and thereby brought back the Ribb again into its proper place.

Some there are indeed who endeavor the bringing back of the broken Ribbs into their places again by the applying of Cupping-glasses: but Most Physitians dislike this practise, there being great cause to fear lest that by this means there be more of the humor attracted: and that otherwise the flesh above the Ribbs is wont to be puffed up. But if any broken fragment of the Ribb prick the Membrane, so that thereupon most grievous pains and other ill symptoms arise, (in so much that there be great cause to fear death) that part wherein the Ribb is broken is to be opened with the incision knife, that so we may the better come at the fragments that prick, either to pluck them forth, or to cut them off. And if likewise there be present any contusion or bruise, a vein is then to be opened, lest that an Inflammation follow.

The Ribbs being reduced unto their own places again, Nature will then indeed of her own accord generate the *Callus*; which that we may the better assist, some Emplaster that is convenient for a fracture of the bones is to be imposed; among the which this that followeth is one of the chiefest.

Take *Pouder of Myrtles, and red Roses, of each one ounce; the Meal of Barly, of the bitter vetch orobus; and of Lentiles, of Beans, and of Mastick, of each two drams; Acron Cups, Cypress Nuts, (the rinds of them) Frankincense, Dragons blood, Earth of Lemnos, Aloes and Myrrh, of each two drams; Oyl of Myrtle, of Roses, and oyl omphacine, of each nine ounces; Wax and cleer Turpentine, of each half a pound; and make an Emplaster.*

Some there are that (in the progress of the disease) wet and soak the swathes in Rosemary water; which (as they write) is a very special and effectual water in all fractures of the bones.

But if the flesh be moyst and flaggy, then the Medicaments before propounded are to be imposed; and the place is to be streyned together with swathes and other Coverings, that so the flesh may again be conjoyned with the bone. And if through Negligence of the Physitian, or the sick person himself, the Malady be now become old and inveterate, and that the flesh be rendered soft and snotty (so that there be cause to fear lest that the bones, Gristles, and Membranes may be hurt) we are then to do our endeavour that the said snotty Juice may be discussed by such digesting Cataplasms as we shall anon speak of. But if this may not be done, the burning iron is the best Remedy; and yet here we are to be very cautious, that the bone be not made hot, or the inward parts hurt.

If that which was bruised tend toward a Suppuration, the Matter is then to be resolved, and evacuated with a Cataplasm of *Barly meale, Bean meal, or of the bitter vetch Orobus, Camomile flowers,* and the like. As,

Take *Meal of Beans and Barly, of each*

two

two ounces; Wormwood, half an ounce; the pouder of Camomile flowers, Melilote, and Eldern, of each one ounce; boyl them in Spring Water; and then add Oyl of Camomile and Roses, of each one ounce; and make a Cataplasm.

But if the matter cannot yet be discussed by these Medicaments, all delay is to be avoided, for fear lest that the bone be vitiated; and therefore in that part wherein it most swelleth the part is to be opened either with the Penknife, or with the hot Iron, that so a free passage forth may be opened for the *Pus*.

The Dyet

Let the Patients Dyet at the first be thin and very sparing, and such as is required in other acute Diseases. Let the sick person keep himself as quiet as he can, without any Coughing, or Sneezing (as much as may be) let him not talk much, nor laugh, nor Chafe. See *Hippocrates*, in his 3. *B. of the Joynts*, *Text* 54. &c *Galen* in his *Comment.* upon the place; and *Ambrose Parry*, in his 14. *B.* and 12. *Chapter.*

Chap. 18. *Of the Fracture of the* Spina Dorsi, *or* Back-bone.

AND sometimes it likewise so happeneth, that from external and violent Causes the *Spina Dorsi* (or Back-bone) and its *Vertebræ* are broken.

Signs Diagnostick

If the *Spina* or Back-bone be broken, then there appeareth a Cavity in that place, and there is a pain and pricking felt; in regard that of necessity those broken fragments of the bones must needs be very Thorny and Pricking, as *Celsus* tels us in his 8. *B.* and 9. *Chap.* And if any process of those broken bones that stick forth be broken, this is discerned by the touch, because that it may be moved this way and that way. And moreover, if the sick person lie upon his Face the pain is so much the greater, and far more then if he stand upright. For there the Skin is extended, and bruised with the sharp broken fragments: but if the sick person stand upright, the Skin is then loosened, and not so much pricked by the sharp points of the broken bones, that prick as if they were Thorns or Goads.

Prognosticks.

1. The process of the *Vertebræ* is easily of it self consolidated, unless some other evil happen to follow, in regard that the bones are Spungy and thin.

2. Otherwise this Fracture is for the most part Mortal, by reason of the hurting of the spinal Marrow, and the Membranes, and the Nerves; and especially if the Fracture happen neer about the *Vertebræ* of the Neck.

3. And if there happen a Fracture in the *Vertebræ* of the Neck, there followeth a Palsey of the Arms and Hands; but if the Fracture chance in the inferior part, then there followeth a Palsey of the Thighs, Legs, and Feet; and this is deadly: but if the motion and sense be not altogether abolished, there is yet some smal Hopes left of recovery.

4. If in the Fracture of the *Vertebræ* there shall appear any voluntary Egestion of the Excrements, and that there happen a suppression of the Urine, it is a very desperate and deadly Sign.

The Cure.

Although there be here but little ground for Hope; yet nevertheless that the sick person may not be wholly left in a helpless condition, the broken *Apophyses* of the Back-bone are again to be put back into their own places (if they be not altogether broken off) and Medicaments are to be impoſed that may moderate the pain, prevent an Inflammation, and further the Conglutination of the bones; and such medicaments as these have already been very frequently mentioned. But if the process be wholly broken off from the Periostium, the Skin is then by an incision to be opened, and the piece of bone to be drawn forth, and the Wound afterward in a due and convenient manner to be healed. And this is likewise to be done, if the fragments or broken pieces of the other *Vertebræ* press together and prick the spinal Marrow and the Nerves thereof; for otherwise the life may be much endangered.

The Fracture of the holy bone, and the Crupper.

Unto the Fractures of the *Spina* there belongeth also the Fracture of the *Os Sacrum*, and the Crupper-bone; which if they shal be so broken and bruised that thereupon the Spinal Marrow be hurt, the Malady then is very dangerous, if not altogether deadly. But if there be any the least hope left, the Finger being put up into the Arse even unto the broken place the bone that is broken is to be driven forth; but outwardly by the other Hand, (or else by the help of some assistant) the bones are to be made equal and even, and so to be put back into their own places again; and afterwards Medicaments convenient for the Fracture are to be applied and laid on.

CHAP.

Chap. 19. *Of the Fracture of the Bones of the Hand.*

THe Bones of the Hand (which are divided into the bones of the Wriſt, upper part of the Hand, and the Fingers, are likewiſe ſomtimes broken.

Signs Diagnoſtick.

The Fracture in theſe bones is eaſily known both by the ſight and touch; in regard that theſe bones when they are broken do for the moſt part decline either unto the exteriour or the interior parts.

Prognoſtick.

Theſe Bones without any great ado, (and indeed within twenty daies) do perfectly grow together again, and ſo are healed.

The Cure.

Let the ſick perſon ſtretch forth the Hand that is hurt upon an even and ſmooth Table: and then let the Chirurgeons aſſiſtant ſtretch forth the broken bones, but let the Chirurgeon himſelf reſtore (with his Hand) the bones into their places again. When the bones are well ſet together, then ſome Medicament (ſuch as is wont to be adminiſtred in Fractures) is to be impoſed: and then afterward the part is to be wrapt about with a Swathe. And indeed if the Fingers chance to be broken, they are to be tied faſt unto thoſe ſound Fingers that are next; that ſo by them (as it were by Splinters faſtened on) they may be kept unmoved in their places. And then at length the hollow of the Hand is to be filled up with a bottom or ball of Linen rowled up together. For ſo by this means the bones when they are ſet are the more eaſily kept in their places, and the Fingers preſerved in a middle Figure. But if either in the extending or contracting the Fingers there be any *Callus* generated, the Office of the Hand in laying hold on any thing is much hurt. And let the Hand alſo (with the Arm hung in a fit Scarf or Swathe from the Neck) be kept in reſt and quietneſs.

Chap. 20. *Of the Fracture of the Hip-bone.*

THe Hip bone conſiſteth of three bones; of which the Firſt is the *Ilium*; the Second, the *Iſchion* bone; and the Third, the ſhare bone; which in Infants may even be ſeparated; but yet nevertheleſs in perſons of ripe Age they grow ſo faſt together that they can very hardly be parted aſſunder. But now theſe bones may be broken (like as thoſe of the Shoulder-blade) either in their Extremityes, or long waies, or in the middle.

Signs Diagnoſtick

This Fracture is eaſily known by the pain, which is more eſpecially exaſperated by the touch and compreſſion; by the Cavity and unevenneſs; and alſo by the pricking and benummedneſs in the Leg of the ſame ſide.

Prognoſtick.

Theſe Bones are conſolidated in the ſpace of twenty four daies.

The Cure

The broken bones are with all poſſible ſpeed and diligence to be ſet together, and to be reſtored into their own places; and then afterward fit and proper Medicaments are to be laid on. But if any fragment of the bone be broken off, and by pricking excite pain, and that there be any fear of an Inflammation, there are ſome who perſwade us that even at the very firſt dreſſing an inciſion is to be made in the Skin, and the broken piece of bone forthwith taken out. But whereas it is very ſeldom that theſe fragments lie hid under the Skin alone, but even under the very Muſcles themſelves; ſuch alike Section as they adviſe us unto may not be inſtituted without much danger. And he that will needs attempt it, let him be very cautious leſt that he hurt the Heads of the Muſcles, or ſome one of the principal Veſſels; or that greater Nerve which is ſtretched forth into the Muſcles of the Thigh and Leg.

Chap. 21. *Of the Fracture of the Whirl-Bone in the Knee.*

AND ſomtimes likewiſe even the Whirl-bone it ſelf is broken; and this happeneth ſomtimes in the length of it (in reſpect of the whole Thigh) ſomtimes in a tranſverſe, and ſomtimes in an oblique manner; and ſomtimes it is broken into two parts, and ſomtimes into very many pieces; and ſomtimes again this Fracture is with a Wound, and very often without.

Signs Diagnoſtick

The Fracture of this bone is eaſily diſcovered by the diſtance of the broken bones, appearing by the touch; by the Patients weakneſs and inability in going; by the Cavity that is perceived (in the place where the Fracture is) both by the ſight and by the touch; and by the Craſhing Noiſe and ſound that is obſerved in the handling thereof; and in its motion.

Prognostick

1. The Whirle-bone indeed (as all other thin bones) easily groweth together again, if it be but rightly Joyned together, and so preserved.

2 And if the fracture be made in the length thereof, the bones may very easily be joyned together; and being so Joyned they may without any great difficulty be so kept in their own places by the use of pillows and Swathes. For whereas about the whirl-bone the extremityes of the Seventh, Eighth, and Ninth' Muscles, that move the ankle and leg, run along together, and end in that most strong Tendon that is implanted in the Whirl-bone; and that the Muscles are wont of their own accord to be moved and drawn toward the place of their originall; therefore even without any great industry and paines, the fracture that is made long wayes may be reduced into its own place again & the bones most closely conjoyned as before; and so no great cause to fear the bunching forth of any *callus*, & a lameness following upon this fracture. *Paræus* indeed (in his 14 Book. and 22 Chapt.) writeth that he never saw any, who having this bone broken was not lame, so that he halted al his life after it: and this even therefore, because that the Concretion of the *Callus* being produced, the Consolidation doth hinder the free bending of the knee. But although this may easily be granted as touching the transverse fracture; yet notwithstanding *Guilhelmus Fabricius* (in his fifth Cent. and 88 Observat.) hath rightly determined, that this is not alwayes necessary (especially in the fracture that is made in the length of the bone) in regard that there is no necessity that there should evermore be bred a *Callus* so sticking forth, that it should cause an impediment of the motion in the knee, and so consequently a lameness and halting: and we may see that in the fractures of other bones Nature doth usually so generate the *Callus*, and with that Neatness and skil, that oftentimes there scarcely remaineth any the least sign or token of any fracture appearing; and this especially happeneth when the *Periostium* is whole & unbroken, which reteineth the matter of the *Callus*, that it may not grow forth overmuch, nor bunch out too far.

3 But if the fracture be made either transversly or obliquely, all the industry that we can use will hardly so cure it as that no lameness nor halting shall follow thereupon. For seeing that the Seventh Eighth & Ninth Muscles moving the Ankle draw it upward toward the hip, but the Tendon that under the knee is inserted into the shinbone draws the whirlbone downward, the bones of the broken whirlbone are so di joyned that they can hardly by any art be joyned together again, or being joyned can be so kept together; whereupon the *Callus* buncheth forth, & the Muscles moving the Leg and Ankle are hurt, and so a Lameness and halting followeth.

The Cure.

The Leg is first of al to be extended: And then after that by the Chirurgeon the Whirlbone (whether it be broken into two or more parts) is to be Joyned together again; and an Emplaster or Cataplasm be fitting the Fracture (that may keep together the bones when they are set) is to be layd on; and the Member is conveniently to be bound up; and by imposing of rowls of Straw (as is wont to be done in the Fracture of the Leg, the Member is to be kept immoveable, and great Care must be taken that the Leg be not at al bended: for if this should be, the broken Fragments that were set together would be again removed out of their places.

If some sharp fragment of the bones be separated from the rest of the bone, and prick the Skin, some there are (as I told you before touching other Fractures) who advise us to cut into the Skin, and so take forth the bone.

If grievous Symptoms shall happen to follow, we must timely oppose them with such Remedies as in other Fractures.

Chap. 22. *Of the* Fracture *of the* Bones *of the* Foot.

And Lastly, The bones of the Foot are likewise somtimes broken; of which how many bones there are. As for that we refer you unto the Anatomists. But *Hippocrates* (in his 2 Book of the Joynts) writeth that the bones of the Foot, as likewise of the Hand, are not at al broken, unless the fleshy parts be wounded by something that is very sharp or heavy. For these bones being harder then ordinary, these things that are sharp and very heavy, if they break these Bones, they leave not the Skin lying upon them whole and sound, but much bruised. And *Paulus Æginet.* (in his 6. *B. Chap.* 106.) writeth, that the Ankle can by no means be broken; not only by reason of its hardness, but in regard that it is fenced and guarded round about.

Signs Diagnostick

If the bones of the Foot be broken, it is easily found by the sight and touch, in regard that these parts are void of flesh: and therefore if they shall stick forth upon their breach, this is easily discovered by the sight, and touch.

Prognosticks

Prognosticks.

1. The Fracture of these Bones is not of it self very dangerous; yet because they are greatly broken by reason of the forcible and violent Cause, the parts incumbent and that lie neer (being Fleshy and Nervous) are withall bruised and wounded; whereupon most grievous pains, Inflammations, and other Evils do arise.

2. And yet notwithstanding for the most part they grow together again in twenty daies, unless such as are nigh unto the Leg: for these being greater require the longer time for Consolidation.

The Cure

The Cure is almost one and the same with that of the broken bones of the Hand. To wit, there ought (in the first place) to be a fit extension; and the Bones (whether they stick forth unto the Superiour or the Inferior part) are to be forced back into their Natural seats; which may most fitly be done, if the sick person stand with the broken Foot upon a plain table covered over with a woollen cloth. And then Secondly, fitting Medicaments (such as the Fractures require) are to be administred. And Thirdly, The Foot is to be wrapt about with Swathes. And since that Splinters cannot conveniently be imposed upon the Foot, by reason of the unevenness of the place the *Splenia* Coverings are to be made use of, and the place to be bound with Swathes, that so the bones being set in their places may be there kept. And yet nevertheless the Situation and placing ought to be ordered otherwise then in the Hands: For our Hands being given us to lay hold upon, the Fingers (as we told you before in the 19. *Chapt.*) are to be placed in a Crooked Figure; but our feet being given us to stand upon, and to walk withal, are to be Situated in a straight Figure, and not crooked, lest that their Action be depraved and hindered.

And thus much we thought good also briefly to speak touching Fractures. For in regard we have extant the most learned Books of *Hippocrat.* upon this very subject, touching Fractures and the Joynts, and the most accurate *Comment* of *Galen* upon them, I held it altogether needless and not worth while to treat more largely of them, as I see that others have done before me: but think it fitter for me to refer the Reader unto them, if he desire to see more hereof.

THE

THE FIFTH BOOK, THE SIXTH PART.

Of Luxations.

Chap. 1. *Of Luxations in general.*

THere are very many Bones in the Body of Man which are compoſed and joyned together after divers ſorts. But they are chiefly compoſed by a *Symphyſis* and Articulation. A *Symphyſis* is a union of the Bones without motion: but the Conjunction by Articulation is compoſed for motion; the differences of it are chiefly two, a *Diarthroſis*, and *Synarthroſis*. *Diarthroſis* is with a manifeſt motion; *Synarthroſis* with an obſcure one, of which conſult with the Books of Anatomiſts.

What Luxation is. When therefore the Bones which are joyned by Articulation do fal out of their place, the Diſeaſe is called by the Greeks *Exarthrema*, by the Latines a Luxation, which is the falling down of the Joynt out of its place (which is called the *Acetabulum* or hollow) into another place; by which voluntary motion is hindered: *What a Joynt is.* where by a Joynt is underſtood, as *Galen* and *Hippocrates* alſo do teach Artic. 1. Text. 1. not that aggregate of the two ends of the Bones joyned together, but only the head of the joynt.

The Cauſes.

Internal Cauſes But the Cauſes of a Luxation are either Internal, or External. The Internal are humors which falling down upon the joynts either do relax the Ligaments that they ſuffer the Bones to fal out of their ſeats, or by filling them up do ſhorten and contract them, that they draw the heads of the bones out of their ſears. To which hæreditary defects muſt be referred, whenas Experience doth teach us, That oftentimes thoſe that have bunches in their backs do generate the like, and lame folks beget lame. *External* But the external violent Cauſes are, blows, fals, violent extenſion, and the like, which can expel or draw forth the Bones from their ſeat; and that ſometimes is done even in the Birth, and the Arms or Thighs may be luxated while the Infants are drawn forth with violence by ignorant Midwives; nay in the Mothers Womb Infants may have a luxation of their bones by a blow, fall, compreſſion, as *Hippocrates* ſeems to intimate 3. *de* Art. 88. and 94. and 4. *de* Artic. Text. 2. and 3. but al cauſes of what kind ſoever do cauſe luxations either by violent diſtenſion or impulſion; moſt commonly a luxation is cauſed by violent impulſion, when from cauſes happening from without, as fals, jumping, blows, and the like, the bones are violently expelled out of their ſeats. Al other cauſes are to be referred to diſtenſion, to wit, when the Cavities receiving the heads of the bones (which the Greeks cal *Cotylæ*) are rendered either narrower, or larger and relaxt, this Cavity is made narrower, when a humor or ſome matter doth poſſeſs the boſom of the joynt and drives the bone out of its ſeat, which happens ſomtimes in pains of the joynts: but the Articulation is made larger or looſer when the brows including the boſom are broken, for ſo the bones may more freely wander and fal forth; and the Articulation is made looſer alſo, when ſome humor doth too much mollefie and relax the Ligaments, and renders the whol Articulation more looſe. The ſame happens when the Ligaments are too much diſtended or broken.

But the Bones are more and eaſier luxated in Children and young folks whoſe Ligaments are ſofter and weaker than in thoſe of riper age, whoſe Ligaments are firmer and ſtronger. It happens alſo in them whoſe bodies are waſted and have weaker Ligaments; but thoſe who are fleſhy and wel habited have not their joynts eaſily fal forth, whenas the joynt is on every ſide ſtraightly girt in with ſtrong Muſcles; alſo thoſe joynts are eaſier luxated which are compoſed for many ſorts of motions; but thoſe which have fewer different motions do not ſo eaſily fal forth of their ſeats; thoſe joynts alſo which are contained with one Ligament are more eaſily luxated than thoſe with two; the greater bones alſo are more difficultly luxated, and not unleſs by a violent cauſe; the leſſer bones more eaſily: laſt of al, ſome bones do more eaſily, ſome more hardly fal out of their places, according to the nature of the Articulation, as afterward ſhal appear in particular. This muſt be obſerved in general, That the joynts which are in a plainer boſom are more eaſily luxated; but thoſe which are hid in a deeper boſom more difficultly.

The Differences.

The proper Differences are taken either from the Subject, or the Form, or the Efficient Cauſe. From the Subject, becauſe the bones which are luxated are joyned either by a *Synarthroſis* and with an obſcure motion (as when the broad bone of the ſhoulders departs from the ſhoulder bone;) *The Differences from the Subject*

or the Channel Bone from the top of the broad bone of the shoulders, or the radius from the Elbow; which kind of Luxation the Arabian Interpreters cal a disjunction, when the bones gape as it were; or by a *Diarthrosis* with manifest motion, which Luxation is most properly so called. There is also a peculiar kind of Luxation, but improperly so called, when the Epiphyses of the bones are pulled from the bone on which they were placed, which happens chiefly to young folks.

From the Form

From the Form because the Joynt sometimes wholly fals out of its seat: which Luxation is called by the general name *Exarthrema*, or Luxation; but sometimes it fals forth only in part, and to the brink of the bosom or hollow, which the Greeks cal *Pararthrema*, the Latines a Subluxation; to which kind of Luxation also belongs that elongation, when the Ligaments being luxated and made longer, the joynt indeed according to the longitude doth sometimes depart from its seat, yet fals not wholly out of it.

From the variety of the scituation

But from the variety of the Scituation to which the joynt fals forth there are fetcht three differences chiefly: The first is, if the bone which is naturally placed in the upper part fal out to the lower; or on the contrary The second is, if that become on the right side which ought to be placed on the left; or on the contrary it fal from the left to the right, which others cal outwardly or inwardly. The third is, if that which was placed in the fore part fal to the hinder, and on the contrary that which was placed behind fal out to the fore part; and the joynts of some parts may be luxated into al these differences, some only into certain differences, not al; so the elbow, hand, thigh fal forth into four differences, viz. To the inward, outward, forward, backward, but cannot upward; the knee fals out into three scituations, viz. The inward, outward, and hinder part towards the ham; but the opposition of the patel bone hinders its falling out to the fore part, of which shal be spoke hereafter in the Luxations of the particular parts.

From the Efficient Cause

The Difference is taken from the Efficient Cause, because the Luxation is sometimes from external Causes, as fals, blows, jumpings, running, and from a violent distorsion, extension, and impulsion of the part, but sometimes from internal causes, as while a humor sliding into the cavity of the joynt drives it out of its place.

Improper Differences

There are also certain improper Differences, or rather complications of other preternatural Affects with Luxations, as that an Inflammation, fracture, wound, or somwhat else is joyned with the Luxation.

Signs Diagnostick.

A Joynt being fallen forth into another place is easily known by the sight and touch; for there appears a Tumor in the part into which the joynt is fallen, but a hollowness in the place from whence the joynt is fallen; and that appears so much the easier, if the body be not very thick and fat, or the place be void of flesh. Again, if the Luxation be perfect, that Member is made shorter, whenas the joynt no longer included in its Cavity, but falling out of it, is drawn upwards: yet sometimes the Member becomes longer, as is afterwards said in particular. When then the Member luxated is alwaies unlike to the sound one in scituation, figure, and longitude, we must alwaies compare the Member affected with the like sound part of the same name, Arm with Arm, Thigh with Thigh in the same man; where yet we must observe, that the Member with which we compare it be sound, and have no fault. Thirdly, because Articulations are made for motion, if a joynt fal out of its natural seat it must needs be that the motion of the joynt is hurt; therefore where there is a suspition of a Luxation, yet the motion is not hurt, we must conclude that there is yet no luxation made. Lastly, because a joynt falling forth of its seat doth compress the sensible parts into which it is fallen, as the Tendons, Nerves, Muscles, from thence there is raised a pain.

And these are the signs of a perfect Luxation; but if there be only a Subluxation, the Signs propounded wil either be more gentle, or some of them wil be wanting.

If there be a Luxation of a joynt joyned by a *Synarthrosis*, in which the Bones do gape, it is known by the thickness of the Member greater than usual, and by a greater bunching out than the heads of the bones do consist of.

The signs of the Causes

As concerning the Causes, the external and violent are apparent by the relation of the Patient, and the Luxation proceeding from thence happen suddenly; but if the Luxation be by reason of the looseness of the Ligaments, it happens by degrees; and the luxated Member is moved and totters up and down with inordinate motions; and whiles the joynt is forced into its seat, the Member indeed acquires its natural longitude, which being let alone again presently it becomes longer.

Also if the head of the Bone luxated be thrust with the fingers to the contrary part, it easily recoil back; every where about the joynt there is a Cavity begotten, that if the finger be thrust into the joynt it easily goes in, no body resisting, as if al were empty.

When some *Epiphysis* is pulled off from its being, it is known by the impotency of motion, and by the crackling, when they are handled and moved.

The

Prognosticks.

1. In the Bodies of Children and yong folks, and those that are softer the bones luxated are easily restored, yet being restored are not so faithfully retained; the contrary happens in riper and harder bodies.

2. The Joynts which are dedicated to fewer differences of motions are more difficultly replaced, but better contained.

3. By how much the further the joynt is fallen from its bosom, by so much the more difficultly 'tis restored; by how much the neerer, by so much the sooner.

4. The Luxations in which the brows of the bones are broken are worst of al; for though the joynts be restored to their places, yet they continue not long, but fal out again upon the sleightest cause.

5. The joynts which are fallen forth by reason of the Laxness of the Ligaments, though they be replaced, yet do easily fal forth again.

6. Those Luxations which have a great pain, inflammation, or wound happen on them, are hard to be cured, and want not their danger, and cannot be restored without danger of Convulsions, nay of death. Wherefore if the bone being reduced the Nerves be distended, it must presently be forced out again, as *Celsus* doth counsel.

7. Old Luxations and which are grown hard with a Callus, and which have a clammy humor filling up the Cavities of the Bones, are never or very hardly cured; therefore every Luxation must presently be replaced.

8. They who in their Childhood have had their joynts fal forth, and are not replaced, they grow less than others.

9. What Member also soever hath been troubled with a long continued Luxation, by how much 'tis the less able to be moved by a natural motion, by so much the more 'tis extenuated and wasted, both because by intermission of motion the Native heat of the part is dulled, and because the Vessels are compresst by the luxated joynt, and the necessary influence of blood and spirits is hindered.

10. A Luxation of the head brings death, by reason of the compression of the Spinal Marrow presently at its first rise, and the prohibition of the influx of animal Spirits.

We shal afterwards speak in particular of the Prognosticks of the rest of the joynts.

The Cure.

The Bone luxated, and which is fallen out of its natural seat, shews a reposition to its natural place; and this Indication is satisfied, and Luxations are cured by straining and forcing them to the part opposite to that from whence the change is made; which replacing of the joynts fallen forth of their seats is called *ton arthron embole*, and *arthrembole*. But the replacing of luxated Bones is compleated three waies, either by the hands of the Chirurgeon and his Servants, which is the most simple, and is called Palestrical, because 'twas used in the wrestling places if at any time the Fencers Limbs were luxated; and 'tis convenient in soft bodies, and where the evil is fresh; or by some vulgar instruments the joynts are forced into their seats, as by the help of reins, swathes, ropes, ladders, seats, two leav'd doors, which is called the Methodical way, and is convenient for children, women, and the stronger males, and for old luxations; or 'tis performed by instruments and certain singular engines, and 'tis called organical, and 'tis applied to stronger bodies and old Luxations, and altogether to those which cannot be restored the two former waies. But concerning such Engines see *Hippocrates de artic. & fractur.* and *Oribasius de machin*: Others hold only two waies, the Palæstrical, and Physical; and under Physical comprehend the Methodical and Organical.

How many Operations are required to the reducing of luxated parts.

But what way soever the restitution of the luxated bone is performed, four operations are necessary to it, Extension, Replacing, Rowling, and Confirming & placing of the Member reduced: for first of al, whenas the Muscles are contracted, as we have said of Fractures, there is need of extending the luxated member, which must be done presently after the Luxation is made; or if the Chirurgeon be called late, when the fear of Inflammation is over; and so far it must be made, that some free space may be left between the bones, lest the joynt or head of the bone be rased, or the brows of the bosome be broken; and in the Extension a convenient figure of the part must be observed, and the Muscles on one part must be kept whole, and not be distorted, to wit, lest the Head of the Muscle be in the internal part, and the end of it in the external. But Extension is made either by the hands of the Chirurgeon, or his servants; or with Reins, Ropes, and Swathes, or with Instruments and Engines, as was said before.

Extension:

Replacing

Sufficient extension being made, the bone which is fallen out of its place must be replaced in it, which labor the Greeks cal *Mochlia*, and *Mochleusis*, viz. the compulsion of the bone luxated and extended into its seat: but that this operation may be done rightly, both the nature of Articulations, and how al the bones in the body are joyned together, and the differences of Luxations ought to be known; for the Chirurgeon wil not know certainly into what place he ought to force the luxated bone, if he do not rightly know before, out of what natural place it is fallen; for the Chirurgeon ought to consider from whence the Joynt hath first fallen, what pro-

gress it hath made in its fal, and whither 'tis come at last; and from the end of its fal, the same way by which it fel forth, to force it back again to the Joynt from whence it fel: as if a Joynt be fallen forth from the left towards the right, he ought to force it towards the left; if it be fallen from the right towards the left, then towards the right; that which is fallen towards the forepart must be forced to the hinder part; that slipt forth to the hinder part towards the fore part. And there are so many waies of this reduction, as there are Joynts; for example sake, the Shoulder is one way, the Foot another, and the *Vertebræ* another way reduced into their place; and the Shoulder otherwise when 'tis fallen into the Arm-pit hole, otherwise when to the fore part. But the bone must be forced into its place gently, and if need be applying first of al laxative & mollefying Medicines, lest there be a contusion or grating of the head and bosom upon one another, or a pain or Inflammation be caused; and we must avoid wheeling about the head of the bone, lest it break.

But we shal know that the Joynt is rightly reduced, if the member and juncture recover its natural figure, longitude, and lost motion, and it wholly agree with the like named sound member, and the pain which was present before do cease. There is wont also for the most part to be heard a certain crackling and sound when the bone returns into its Cavity, but we must not trust to this sign alone, for sometimes there is a crackling made, and a noise heard by reason of the breaking off of the brows of the bone, which may be, when the head of the bone is so struck against the brows, that somwhat of them is broke off; and then whenas that part of the brow broken off doth sooner get into the bosom then the Joynt, the replacing cannot be right. A crackling and noise also may be caused, when in a violent reducing the joynt or head of the bone hits against the bosom, and contuseth it, whence the Cartilage is separated from the rest of the bone, and there is a difficulty of motion; therfore all the other signs must be joyned together.

Binding: The Joynt being reduced into its seat, the distention must be bated, and we must suffer the Muscles to return to themselves, and afterwards the member must be so strengthened that the Joynt cannot again go out of its place; which is done almost after the same manner as in Fractures; for first of al before binding up be ordered, astringent medicines must be laid on, which hinder a flux of humors and Inflammation, and contract the Ligaments relaxt, and strengthen the part; of Bole, *Sanguis Draconis*, Pomegranate Pils, Pomegranate flowers, Roses, Frankincense, fine Flour, and the like, mixt with the white of an Egg; if the pain be great those things also which together with an astringent faculty do mitigate pain, as Oyl of Roses, Mastick, and the like. Or,

Take *of the greater Comfrey, Bean flour, Bole armenick, of each three ounces; steep them in Vinegar and dry them: afterwards*

Take *of Litharge, Wax, Rosin, of each three ounces; melt them over the fire and add the things forementioned steeped in Vinegar; and last of al two ounces of Tragacanth. Make a Plaister.* Or,

Take *of new Wax three ounces, Mistleto of the Oak, Mastick, Rosin of Pine, of each half an ounce; mix them.*

Then the Member must be conveniently bound up, with Rowlers and Bolsters, as we said concerning Fractures. And *Gabriel Fallopius* teacheth at large, *Tract. de Luxat. c.* 5. that the bone may be kept in its place, and the flux of humors hindred. If need be, and the figure and nature of the part wil suffer it, Splints must be laid on of Pastboard, or Leather, or some other convenient matter.

Placing of it: Last of al, the member must be placed gently, evenly, and that the position keep a middle and natural figure, lest pain be caused, and it must be kept unmoved til the fourth or seventh day, unless an itching, pain, or other Symptom do urge; and afterward it must be strengthened with conveniens Medicines.

Chap. 2. *Of a Luxation with Pain, Inflammation, Wound, Fractures.*

BUt it happens sometimes that the Luxation is not alone, but other preternatural Affects, Pain, Inflammation, Wound, and Fractures are joyned with it. But if before the Physitian be called Pain and Inflammation hath already seized on the part affected, we must not try to restore the luxated Joynt, til the Pain and Inflammation are allaied; for if that be tried before this is done, it is to be feared, lest by the distension of the Nerves a Convulsion, or some other dangerous Evil arise; therefore before the replacing of the Joynt be attempted the pain must first be mitigated, and the Inflammation allaied, by those medicines which are formerly mentioned. If after the Joynt be replaced, and the binding be loosened, there be an Itching, the place must be sprinkled with warm Water, that the humor the cause of Itching may be discust, and the pain abated; otherwise if there be no Itching we must forbear warm sprinklings, lest the Ligaments be relaxt; or rather when the binding is loosened, the place must be fomented with some strengthening Decoction. As

Itching:

Take *of the Leaves of Myrtle, Oak, Wormwood, of each one handfull; red Rose flowers half a handful, Pomegranate rind one ounce, Pomegranate flowers, Misleto of the Oak, of each half a handful: Boyl them in harsh Wine.*

If

A Luxation with a wound:

If a Wound be joyned with the Luxation, that is very dangerous and oftentimes kils the man, whenas from distention of the Nerves and Muscles, a Pain, Inflammation, Convulsion, acute Fevers are caused; and the danger is by so much the greater, by how much the Member is greater, and the Nerves and Muscles about it are the greater; whence a Luxation of the Shoulder and Thigh with a Wound for the most part brings death: and the danger is the greater by how much the Wound is neerer the Joynt; and therefore *Hippocrates* is against the reducing of luxated bones and their bindings up, and commands to use at the beginning only things that assuage pain, and take away Inflammation, and thinks that none of these can safely be reduced, besides the Fingers, Hands, and Feet; & in these also he commands al things to be done very diligently; for neither a Finger (in wch there is least of danger) ought to be replaced when there is an Inflammation, but either before the Inflammation comes, or after tis allaied. But much more is this to be done in other Joynts, of al which *Hippocrates* (Artic. 4. Text. 16. and 17.) saith, *For in whomsoever the bones of the Leg luxated with a wound made, do wholly hang forth from the joynts of the foot, whether they tend inwardly or outwardly, they are not to be reduced, but let them suffer he that wil to replace them; for ye may know, that if they remain reduced they shal die, and their life shal be of very few daies, for there are few of them which pass the seventh day; for that which kills them is a Convulsion; moreover it happens also, that both the Leg and the Foot do gangræne. We must know for certain that these things wil so come to pass.* And there also Text 28, 29, 31. which places there you may see, and also *Galens* Comment. And therefore presently at the beginning, and before an Inflammation come in a Fracture with a wound, we must try whether the joynt may be restored into its seat with moderate extension (for it can by no means endure strong) which if it succeed to your mind we must labor chiefly in this to keep off an Inflammation; but if the joynt being replaced an Inflammation or Convulsion doth happen, the joynt must be thrust out of its place again (if it can be done without violence) or if we fear this danger, 'tis safer (especially in the greater joynts) to defer the reducing til the Inflammation is ceased, and the fear of it is past. When the Inflammation is now ceased, which is wont to be about the seventh or ninth day, both must be signified & foretold to the standers by; and the danger which is at hand by the reducing, and the weakness of the part, by which the man is rendered lame and maimed if the joynt be not restored: and if they urge the restitution of the joynt, it must be attempted without any violence; afterwards the Cure of the Wound must be ordered as in a fracture with a wound, but the member it self must be so placed that the Patient (as much as may be) may be free from pain. See *Hippocrates* of these things in the place before alleadged. Sometimes also it happens that a Fracture is joyned with a Luxation, therefore the Chirurgeon must be wary; and if the Fracture offer it self neer the Joynt, let him consider whether the Joynt be whole or luxated, lest while he cure the Fracture he neglect the Luxation. Thus I remember a Neighbors Child, a Boy about nine yeers of age, whenas a Vessel into which they were wont to pour their hot Drink after it was boyled, fel upon his Thigh, and his Thigh-bone was broke, and the Joynt of the same luxated, which when the Chirugeon observed not, and only Cured the Fracture and restored not the Hip-joynt, the Boy became lame. But if there be a luxation with a Fracture, the Member must be extended the common way, and the luxated Joynt must be reduced into its proper place, and the broken bones must be conformed and composed; and first of all indeed the luxated Joynt must be replaced if it may be done, then the Fracture must be Cured, and fit Medicines must be laid on them both, of which we have spoken already; and convenient binding up must be ordered; but if the Joynt cannot be restored to its place without danger before the Fracture be cured, then the Fracture must be cured first; afterward when the callus is generated, we must endeavor that the luxated Joynt also be restored.

The Cure of an old Luxation.

Last of al, if a Luxation by reason of an Inflammation coming upon it, or a Wound or Fracture joynd with it, cannot presently be restored, but there is a callous hardness contracted about the Joynt, the place must be fomented either with plain warm water, or with a mollefying Decoction made of Marsh-mallows, Mallows, Camomile flowers, Fenugreek seeds, and the like; but after the Fomentation the Joynt must be anoynted with Oyntment of *Dialthæa*, or some other mollefier, or this like Cataplasm must be laid upon it.

Take *of Marsh-mallow roots, wild Cowcumber, of each three ounces; Mallows, Marsh-mallow leaves, of each a handful: Boyl them til they are soft, and searce them through a hair Searce; add of the Flour of Fenugreek, Flax seed, of each half an ounce; Oyl of sweet Almonds, Hogs grease, as much as is sufficient; make a Cataplasm.*

If the hardness be greater, add to the things boyled, wild Cowcumber root, and lay on it *Diachylum magnum.*

When the Member shal be sufficiently mollefied if need be Digesters may be applied; as Betony, Sage, Hyssop, Groundpine, the Plaister of Betony, and the like. Or Suffumigations with a fire-stone or Mil-stone, or Bituminous and Sulphurous Baths, if they may be had; Lastly, when whatsoever was hard is mollefied and discussed, the

the joynt in convenient manner must be restored to its place, and the rest must be performed as was said above, Chap. 1.

Chap. 3. *Of a Luxation of the Mandible.*

AND let it suffice to have said this briefly of Luxations in general; now we must say somwhat in particular of the Luxations of the chief joynts.

And first of al as concerning the Luxation of the Mandible; whenas Nature hath made only the lower jaw movable in al creatures, the River Crocodile excepted, (which as *Aristotle* witnesseth, 1. Hist. Animal. c. 11. and 3. Hist. Animal. c. 7. moves its upper Jaw) it is easily apparent that that only can suffer a Luxation. The which notwithstanding is not easily luxated, by reason of the most straight coarticulation of it with the bones of the head, and the exceeding strength of the Muscles that draw it upwards; but into what part the Mandible may be luxated, its structure and insertion do plainly teach us: For as concerning its structure, it hath two processes in its hinder part on each side; the former of which drawn forward being broad and thin ends as it were in a point; but the latter is carried backwards and makes a long and transverse head; that is inserted into the *Os Jugale*, but this is fitted to the second bosom ingraven in the Temple bone.

The Differences.

From which it doth manifestly appear that the lower Mandible cannot be luxated to the hinder part, because the Teat-like processes of the Temple bone do hinder it; nor to the right (especially in those of ripe age) because the left head of the Jaw hinders; nor to the left, because the head of the Jaw in the right side hinders that. In those of ripe age I said, for 'tis wel known by Anatomy that the lower Mandible in Infants is cleft, and in the midst of the Chin is joyned with a great deal of Cartilage; which Cartilage if it be relaxt by a flux of humors, or the Chin be struck, that the bone be separated from the Cartilage, perhaps the Jaw may be luxated to the right or left side, the which yet seldom happens, and therefore is not considered. But in the riper aged because that Cartilage hath so degenerated into a bony nature, that it can by no means be separated, no not by boyling, nay not the least footstep almost remains of a line, or any seam, but it appears one continued bone, Physitians do rightly affirm that the luxation can be made only to the fore part. But this Luxation happens, if the former and sharp process, like to a Beak, which by the Greeks is called *Corone*, do slide forth below the *Os jugale*, that it becomes so much lower then it, that it can no more return upwards again into its place; for otherwise though this process be let lower then the *Os jugale*, yet there is not presently a Luxation made, but the mouth being shut it returns into its place again; but this Luxation is made either in one side only, when only its right or left part slips forth; or in both sides together, when the whol bone of the lower jaw on both sides is fallen out of its seat.

The Causes.

But the most common Cause of this Luxation, nay almost the only Cause, is the too much opening and gaping of the mouth, whether it be by yawning, or by taking some heavy burden in the Teeth, and lifting it on high, so that the forenamed process becomes lower than the *Os Jugale*, as was said, and withal be turned aside; for its return into its seat is not prohibited unless it be turned aside. Yet this very thing happens seldom and hardly, and the Jaw is seldom luxated, by reason of the strength of the Muscles by which 'tis tied to the upward parts. For from both processes of the lower jaw arise Nervous and most strong Tendons, with which the Muscles are inwrapped which are called *Crotaphitæ* and *Masseteres*.

Signs Diagnostick.

That the jaw is fallen out of its seat may be known in general, because the lower jaw hangs forth to the fore part, and the process of the bone like to a beak stands out by the jaw. For if the process resembling a beak fal out of the *Os Jugale* it must needs be that there also it hang forth, which in a man not very fat is easily known both by sight and touch. The mouth remains open, whence the speech is hindred, and the spittle flows forth involuntarily.

If the jaw be luxated on one part, that with the chin is inclined to the contrary part which is not luxated; the mouth is distorted, whence the Teeth cannot be joyned, neither do they answer to their equals, but the dog-teeth are under the Cutters. In the luxated part there is perceived only a certain bunching out, and the temporal Muscle appears stiff. But if the jaw be luxated on both sides, al of it with the chin hangs forth, and that straight out towards the fore part or to the Breast; the lower Teeth go further out than the upper, yet they answer one to another, the Cutters to Cutters, the Dog-teeth to Dog-teeth; neer the Cheeks on both sides there appears a certain eminency, which the acute beak-like process doth make; the temporal Muscles, whose Tendons this process doth receive, (yea is wholly compassed by them) appear stretcht, stiff, and hard.

Prognosticks

1. The Luxation of the Mandible is a dangerous evil; and a jaw luxated (as *Hippocrates* teacheth 2. *de Art.* and *Galen* in his Comment) must speedily be replaced; since that the temporal muscles and the Nerves inserted in them (and consequently the brain it self) are easily drawn into consent

conſent. For the temporal Muſcles have the greateſt conſent with the brain, and do receive nerves from the brain of the third conjugation, from whence do ariſe not only pains, inflammations, continual feavers, dul ſleeps, but alſo death it ſelf is often haſtened about the tenth day.

2. Thoſe whoſe Mandible is not reduced, are wont to void by ſtool filthy and thin Choler; and if they vomit, the vomit is pure.

3. Yet there is greater danger inſtant; and the replacing is harder if the jaws be luxated on both ſides, then if only on one ſide, whenas al the Muſcles with which the jaw is contained are then diſtended.

The Cure.

The Mandible luxated ſhews that it muſt be reduced into its ſeat again; which how it ought to be done, *Hippocrates* teacheth 2. *de Artic. t.* 15. and 16. in theſe words. *One ought to hold the head of him that is luxated, another the lower jaw, the man gaping as much as he can conveniently, and taking it about the chin with his fingers both within and without, firſt a little while to ſtir it up and down, and then with his hand to move it aſide, and to command the Patient that holding the luxated jaw be further it, and be very obedient to him moving it. Then endeavor muſt be uſed, that at once of a ſudden we ſtrike it off of its three figurations; for the lower jaw muſt at once be promoted from its diſtorſion to its natural poſition; and it muſt be driven backwards, and the Patient obeying theſe ought to ſhut his mouth, not to gape any longer; and this indeed is the reducing of it, which cannot be done by other figurations; but afterwards a little Phyſick wil ſuffice, a bolſter laid on with a Cerote, we apply a looſe binding up; yet we perform this office more ſafely if the man be bended backward, and his head ſupported with a leather Cuſhion wel ſtuffed put under it, that it may yield as little as may be.*

If the jaw be luxated on both parts

For we muſt ſee firſt whether the jaw be luxated to both ſides or one; if both parts of the jaw are fallen forth, let the Patient be placed on ſome low ſeat, and let his head be urged either to the wal, putting between ſome hard Cuſhion; or let it be held faſt by a ſervant placed at the back of the Patient, or the Patient lying on his back, as you may ſee by the figure in *Hippocrates* in the place alleadged, text 17. let it be held faſt by a ſervant ſtanding at his head, and kept unmovable.

Afterwards the Chirurgeon ought to put both his Thumbs wrapt up in linen on the grinders, but with the reſt of his fingers to lay hold on the jaw outwardly about the chin, and try to reduce it by a manner and motion contrary to that which is fallen forth; which he may do, if firſt of al he draw the jaw downwards; becauſe the temporal Muſcles have ſnatcht the acute proceſs upwards; ſecondly becauſe the jaw is fallen to the fore part he muſt force the ſame to the hinder part; thirdly becauſe it was drawn downwards he muſt drive it upwards; al which operations a skilful Chirurgeon may ſpeedily and in a moment perform.

If on one ſide

But if the jaw be fallen out of its ſeat only on one ſide, the way of reducing it is the ſame, this only muſt be peculiarly obſerved, that the Jaw being drawn downwards and forced backwards, afterwards alſo muſt be ſtirred to the oppoſite ſide, and at once thruſt upwards.

Reduction being made, a Cerote of Wax and Oyl of Roſes muſt be applied to the heads of the Jaw or Temples; and if there were ſtrong extenſion made, to hinder an Inflammation aſtringent Medicines muſt be laid on with the white of an Egg, or others, as in other Luxations.

At laſt convenient binding up muſt be made, which muſt begin from the Chin, and tend towards the crown of the Head, and it muſt not be looſed before the third day. Let the Patient forbear from much talk, opening of his mouth, and gaping, and chewing of hard meats, and let him be content with Liquids.

If an Inflammation or other grievous Symptom be at hand, that muſt be conveniently oppoſed, as hath been often ſaid; and if there be joyned a pain of the Eyes and Neck, we muſt let blood in the Arm, as *Celſus* adviſeth, *l.* 8. *c.* 11. and the Temples and Neck muſt be anointed with Oyl of Roſes and Worms.

Chap. 4 *Of a Luxation of the Channel Bone.*

THe Channel bone alſo is ſomtimes moved out of its ſeat, which *Galen* proves by his own example, in *l. Hippoc. de artic. com.* 1. *tex.* 62. where he reckons up at large, how when he was thirty five yeers old in the wraſtling place this joynt was ſo luxated that between the top of the ſhoulder-blade and the throat there was three fingers ſpace, and what was done about it.

But the Channel Bone is luxated either againſt the Breaſt bone, or againſt the top of the ſhoulder bone; yet both of them ſeldom happens, by reaſon of its firm conjunction with both bones.

Signs Diagnoſtick.

But a Luxation of this Bone is not eaſily known; and *Ambroſe Parry* writes, *l.* 15. *c.* 11. That he hath known many Chirurgeons, who being deceived have taken a Luxation of the Throat for a Luxation of the top of the Shoulder. But it is known, becauſe the top as it were of the ſhoulder doth ſwel, and in the place from whence the Channel Bone is departed there appears a manifeſt Cavity; there is alſo a pain, inflammation, and

and an impotency to move and lift up the Arm, and to other motions that are performed by the help of the Shoulder.

Prognosticks.

1. This bone is hardly reduced and returned into its natural seat, but for the most part hangs forth more or less from the upper part.

2. But unless it be restored the Patient wil fail in some motion of his Arm, and cannot move his Hand neither to his Head, nor Mouth.

The Cure.

This Bone according to the variety of the Luxation requires divers Restitutions. In general, the Arm must be extended, and the channel bone thrust back into its place, which is done, if he lie on his back with a hard Cushion put under his Shoulders, that the Shoulder and Breast may bunch forth outwardly, and by lifting up, pressing down, or drawing the Arm forward, and backward, as need requires, and pressing it with the palm of the hand, this bone may be forced into its seat; afterwards fit Medicines and many bolsters must be laid on, and the part must be bound streightly; which strict binding few men can endure; yet *Galen* writes that he suffered such strange binding, that he could perceive the motion of the Arteries under his Throat.

Chap. 5. *Of a Luxation of the Back bone and Ribs.*

OFtentimes also the *Vertebræ* of the Back bone are luxated, and especially those which are in the Back, whence is a bunch in the back; but whereas I have treated of this, *l.* 2. *par.* 2. *ch.* 11. I wil not do it over again, but send the Reader to that place; two things only I add, the first concerning a Fracture which is made on the outer parts; if it be new, and made by a violent cause, it must presently be replaced by the help of a Chirurgeon, of which business do treat *Hippocrates*, *l.* 4. *de art.* *Galen* in his Comment. *Paulus Ægineta*, *l.* 6. *c.* 177. *Oribasius de mach. c.* 35. *Celsus l.* 8. *c.* 14. *Parry*, *l.* 15. *c.* 15. and 16.

A Luxation of the Vertebræ *outwards:*

But because this Evil steals by degrees upon Infants, and 'tis oftentimes hereditary, for the most part it is incurable: yet if there remain any hope of recovery, the Cure is done by convenient Plaisters which bind and strengthen the part affected, on which an Iron Plate must be laid, which by degrees may force the *Vertebræ* into their place. But that Plate ought to be so long and broad, that it comprehend the whole bunch; and that it may press it the stronger, the inward part which is next the bunch ought to be filled with Cotten closely bumbasted, and covered over with Linen; but this Plate must be so fastened and sewed to a Stomacher made of Linen or Bumbast, that when it is put on it may comprehend the part affected. This Stomacher must be tied with Strings, in other parts moderately, but about the part affected very straight, that the Plate may compress the bunching *Vertebræ*: and if the Luxation be in the *Vertebræ* of the Loyns, this Stomacher ought to comprehend not only the Breast, but al the lower Belly also, to the Privities.

Such a Plaister may be made.

Take *of common Oyl, Hogs grease, of each three ounces; Deers suet one ounce and half; melt them and mix them over the fire, then cast in two ounces of red Lead: Let them boyl with continual stirring til they begin to look black and grow thick; by and by add two ounces of Pitch: Afterwards by degrees strew in two ounces of white Vitriol poudrered, then add two ounces of Litharge: and at length when they are almost boyled to a just thickness, add one ounce and half of Tacamabacca; stir them again and boyl them to the consistence of a Plaister.*

Gulielmus Fabricius Centur. 5. Observ. 67. propounds such a one.

Take *of the Plaister Slotanum half an ounce, new Wax two ounces, Osteocolla one ounce, Pouder of the roots of the greater Comfrey,* Terra Sigillata, *of each three ounces; Pouder of Pomegranate flowers, Cypress Nuts, red Roses, of each one ounce; Oyl of Roses or Mastick as much as wil suffice; mix them.*

But before such Plaisters and Plates be laid on, it wil be good for some time before to foment the part with the following Decoction, and to anoynt it to mollefie it, if any thing be hard, that it may be rendered more fit to be replaced. As,

Take *of Sage, Marsh-mallows, Flowers of Camomile, Melilote, St. Johns-wort, of each one handful; let them be boyled for a Fomentation.*

Take *of Oyl of Worms, of Orrace, of white Lilies, of each one ounce; Oyntment of Agrippa half an ounce, Dialtheæa one ounce; mix them.*

A Luxation of the Vertebræ *inwards*

Secondly, if the *Vertebræ* be luxated inwards, the restitution of them is altogether more difficult; yet in tender bodies, if the Evil be new, some Plaister firmly sticking to the Skin may be applied to the place affected; and the luxated *Vertebræ* may be drawn forth thither.

In those of riper age *Guil. Fabricius*, Cent. 5. Observ. 69. thinks an extream Remedy is rather to be attempted, then to relinquish the Patient, who otherwise must lead the miserable life of the Disease, or die. To wit (as *Fabricius* teacheth) Incision must be made with a Knife even to the descending appendix of the *Vertebra*; then through the same Wound putting in the Knife again, two Incisions more must be made, one to the right, the other to the left side of the Appendix; then the

Appendix

Appendix being laid hold on by Inſtruments fit for this purpoſe, it muſt be drawn upwards, and the *Vertebra* replaced in its natural ſeat: but in the interim whiles theſe things are done, it muſt needs be that the Back bone be extended, for the *Vertebra* wil the eaſier ſtart into its natural poſition. The Wound muſt be ſmal or great according to the greatneſs of the diſlocation; for if only one *Vertebra* be preſt in, a ſmal Wound wil ſuffice, but if two or more, it muſt needs be great, that both the luxated *Vertebræ* may be laid hold on. If a Flux of blood do hinder, ſo that the operation cannot be done preſently after Inciſion is made, it muſt be ſtopt with Hurds cloſely wreathed up, and wet with the White of an Egg, and ſtrewed with a pouder to ſtop blood; where this muſt be obſerved, that the whole Wound, eſpecially on each ſide of the Appendix be moſt carefully filled up with thoſe Hurds; but that this may be done commodiouſly, many little pillows muſt be made of Hurds wreathed up into this faſhion, and ſo one after another muſt be thruſt into the Wound, til it be filled; afterwards let ſome Plaiſter that wil ſtick faſt be applied, and let it be bound with a Rowler; after ſome hours when the blood is ſtopt, the Hurds muſt be taken out gently, that the blood break not forth again; afterwards the Inſtrument muſt be applied as was ſaid, but the Inſtrument muſt be ſtrong and toothed, as we uſe in drawing forth a Stone, if two *Vertebræ* be luxated, both muſt be laid hold on, and that with two Inſtruments.

There muſt therefore be two Chirurgeons, who muſt equally and with one conſent draw upwards; moreover let the Chirurgeon have a care, that the Inciſions be not made too deep at the ſides of the Appendix, by reaſon of the Nerves which proceed from the ſpinal marrow to the ſides of the *Vertebræ*; moreover it is neceſſary, that this operation be done at the beginning of the Diſeaſe, while the ſtrength is firm, and before the part affected is poſſeſt with an Inflammation and Tumor; neither makes it any matter whether the Patient be without Speech or Underſtanding, which ſomtimes happens. But if the Chirurgeon be not called at the beginning, the ſecond, third, or fourth day at leaſt before the operation the place muſt be fomented with the Decoction of Betony, Primroſe, Sage, Camomile, Melilote, Roſes and Juniper berries; to which he may add ſome things mollefying as Mallows, Marſhmallows, and then try to reduce them; after the operation the Back muſt be anoynted with Oyl of Roſes and Worms, and the Wound alſo muſt be handled after the manner of other contuſed Wounds.

I have writ in the place alleadged, that this operation ſeems to me not ſafe enough, and to which few wil ſubmit; although *Guil. Fabricius* with *Celſus l.* 3. *c.* 33. affirms, that it makes no matter, whether the Remedy be ſafe or not, which is the only one; and he thinks this operation is not ſo dangerous, ſince that in the middle of the Back there are no great Veſſels of Veins and Arteries, beſides the Nerves in the Appendixes are ſmal.

Of the Luxation of the Ribs hath been ſpoken, *l.* 2. *p.* 2. *c.* 25.

Chap. 6. *Of a Luxation of the Shoulder.*

THe Shoulder bone with its round head covered every where with a Cartilage is joyned to the boſom of the neck of the Shoulder-blade by a moſt perfect manner of Articulation, and moſt commodious for the undergoing and performing of all motions, and when as this boſom is not deep enough engraved to receive the head of the Shoulder, leſt this Joynt ſhould be ſubject to often Luxations, provident Nature hath provided by ſtrong Ligaments and a peculiar proceſs, and moreover beſides the Cartilage with which ſhe hath pargetted over this boſom, ſhe hath joyned another about it, which indeed grows not to the boſom; yet being tied with Ligaments begins thicker and by degrees is extenuated towards the Center: yet if a violent cauſe come this Joynt fals out oftener and eaſier then the reſt.

The Differences.

But this Joynt falls out downwards (for the moſt) part or under the Arm-pit hole; for whereas (as *Galen* renders the Cauſes of this buſineſs, *l. de artic. tex.* 2.) there are ſix places about every dearticulation, Above and Below, Before and Behind, Without and Within, the inner part of this Joynt by which it tends plainly upwards hath a fleſhy part of a Muſcle caſt over it, which by ſome is called *Deltoides* from its likeneſs to the Greek letter Δ; but by that part it declines towards the Neck it hath the back of the Shoulder-blade, where by the conjunction with the Neck-bone the top of the Shoulder is made which is called the *Acromion*; where it looks inward, that proceſs meets with the Shoulder-blade, which for its faſhion ſome cal the Anchor-like, ſome the Corniculer proceſs, which wholly forbids that the Joynt fal forth into that part. But that it may fal into the hinder part, whenas there it leans on the Shoulder-blade, Who is there amongſt us that can ſo much as conceive it? There are four parts then remaining, which want a Guard, into which it is likely the Joynt may fall. *Hippocrates* in the alleadged place admits of no other Species of Luxation of the Shoulder but under the Arm-pit; nay he plainly denies that it can fal forth to the fore part; yet *Galen* hath ſeen it five times, once in *Aſia*, and four times at *Rome*; and no wonder, whenas in the Cities where *Hippocrat.* lived there were ſcarce ſo many Men, as in one Street at *Rome*; and therefore there were more Examples of Diſ-

eases, especially the wraſtling place coming into use, by which their Limbs were diversly distorted and perverted. *Parry, l.* 15. *c.* 21. 29. and 30. adds two differences more, viz. upwards and outwards, but those are very rare, and you may see the places alleadged concerning them.

But 'tis doubted whether the shoulder can suffer only a perfect Luxation, or also a Subluxation. *Hippoc.* 1. *de artic. tex.* 22. denies it, and not without cause and reason; for whenas the head of this joynt is round, and inserted into Cavities which have their brims round, it cannot stay in them; and this is altogether true, if the Luxation happen from an external violent cause; but if the thick humors flow into the bosom of the shoulder-blade, and there by their long stay do stick concreted and hardened, they may by degrees thrust the head of the shoulder out of its seat, and cause an imperfect Luxation; yet this happens seldom in the shoulder, more often in the Hip.

The Causes.

From which it appears now that the Cause of a perfect Luxation of the shoulder is a violent cause, a fal, a blow, vehement extension or distorsion of the Arm; but the cause of a Subluxation is a thick humor fallen into the bosom of the shoulder-blade.

Signs Diagnostick.

That the shoulder is fallen under the Arm-pit is easily known, and it is most certainly shewn by its proper and inseparable sign, viz. somwhat round and hard under the Arm-pit is sensibly obvious to the touch, to which notwithstanding other signs also are added, not proper, but common; for there appears an unusual Cavity at the top of the shoulder, but that is a common sign, both of the shoulder fallen forth, and of the broad bone of the shoulder blade. In which things that Physitians are often deceived *Galen* teacheth at large both by his own and others example, 1. *de artic. tex.* 61. the same falling forth of the shoulder is shewed by its unlikeness compared with the sound one, by a sharp bunching out as it were of the upper process of the shoulder-blade, by a departing of the Elbow from the Ribs more than usual, and the difficult and painful bringing of it to them; and the exceeding length and inequality of the same compared with the sound one (unless the shoulder fallen downwards be nevertheless drawn up by the Muscles) and the imporency of the Arm to any motion; which sign also is not inseparable, whenas the Muscles about the shoulders what way soever hurt whether by a Luxation, or by any other Cause, are unfit for motion.

If the shoulder be fallen forth to the fore part, there is seen an unusual Cavity in the hinder part, and too great a bunching out in the fore part, the head of the shoulder is distorted towards the Breast, the Elbow tends to the hinder parts, and is with difficultly stretcht out to the fore parts, and the signs are wanting of a shoulder luxated into the Arm-pit.

Prognosticks

1. The head of the shoulder fallen to the fore part is easier reduced than if it be fallen into the Arm-pit.

2. An old Luxation of the shoulder is very hardly reduced, and being replaced it fals forth again.

3. They who have their shoulder reduced (which is true also of other joynts) the parts adjoyning being affected with no Inflammation, may presently use their shoulder without any pain; and these think they have no need of any further care or providence, but 'tis the Physitians part to correct their opinion; whenas these have their shoulder more easily fal forth again, then those whose neighboring parts are possessed with an Inflammation, for these cannot use their joynts.

4. They whose head of the shoulder could not be reduced, if they grow stil, that shoulder is not equally augmented as the sound one; and though it be augmented somwhat, yet it is rendered shorter than the other; which happens by reason of the compression of the Muscles and Veins, and because the whol joynt is immovable; but in those who at ripe age have the head of the shoulder break forth, and 'tis not restored, the part which is above the joynt is extenuated, and becomes more slender habited.

The Cure

That the joynt of the shoulder fallen forth to the Arm-pit may be restored into its seat from which it fel, three things must be done, as *Galen* teacheth, 1. *de artic. text.* 5. First the head of the shoulder is to be forced to the fore part, then to the upper part, at last to the hinder part, to wit that a contrary way to the Luxation may be undertaken; for the head of the shoulder departing from its proper bosom is first forced to the fore part, secondly by its weight 'tis carried downwards, thirdly 'tis drawn backward to the Arm-pit hole by the Muscles. But if the shoulder be fallen forth to the fore part, it must be forced a contrary way to the hinder part; yet that it may be freed from the Muscles with which it is detained, there must first be some extension of the shoulder made, yet but little.

But the waies of reducing it, as we may see in *Hippocrates.* 1. *de artic.* and other Authors, are various, of which we wil reckon up the chief and most usual, and those which require least preparation, and are most safe.

The

The first way of reducing a luxated shoulder

The first way is by bringing about the head of the shoulder about the neck of the shoulder-blade, to wit, when the Chirurgeon puts his hand most straightly under the Arm-pit, and wheels about the shoulder with the other hand, that the middle joynts of the fingers force it into its Cavity; which way indeed wants not its danger; for by the circumvolution not only the nervous and membranous bodies, but also the brows of the bosom may be razed, nay the Cartilage compassing the bosom cannot easily be pulled or hurt without great dammage; yet it hath its place in children and other softer bodies, so that the Chirurgeon do exercise it warily.

The second way

The second way is by the heel, after this manner: The Patient must be laid with his back on the ground, and between the hollow of the Arm-pit, the head of the shoulder and the ribs, a bal of a middle size made of Leather or some other matter not very soft must be fitted to it; but the Chirurgeon sitting right against the Patient let him apply his right heel, if the right shoulder be luxated, or his left heel if the left, upon the bal put under the Arm-pit, and with both hands let him draw the shoulder downwards (when the head of it is rapt upwards by the strength of the Muscles) but with his heel let him drive the shoulder at once to the fore part and upwards; and at last let him force backwards the head of the shoulder into the Cavity of the blade; the which he may easily do, whenas the Muscles do not only much help this motion, but oftentimes alone do wholly perfect it. Two Servants may make this way of reducing easier, the one of which with a swathe or rein may draw the shoulder-blade upwards towards the head of the Patient, and by this means facilitate the motion downwards, but let him press with his foot the top of the shoulder, and so he wil hinder the shoulder-blade from following, whiles the Chirurgeon draws the shoulder downwards; but let the other hold the opposite sound Arm, and by this means he shal hinder that the whol body do not follow upon the extension made by the Chirurgeon on the affected side. And this way because it is done by a way contrary to the falling forth of the bone, and with extension too, is almost natural, safe, and not so laborious: yet because it wants an impulse, *Galen* thinks it recedes from a convenient manner.

The third way

The third way is by a Ladder, and 'tis also safe and commodious enough; to wit a Ladder is raised up firm and fast, upon whose uppermost step there must be bound some round body, which must be fitted to the Arm-pit of the Patient, and may drive forth the head of the shoulder; at the bottom of the Ladder a footstep is placed which the Patient gets upon; afterwards his Arm-pit is placed over that round body, the luxated Arm is drawn downwards by the Chirurgeon, and the shoulder is moved up and down, in the interim the sound Arm is most strongly drawn downwards at the same time by a servant on the opposite side, and the foot-stool together is drawn from under the feet of the Patient, that he remains hanging on the Ladder, and by this means the shoulder is restored.

The fourth way

The fourth way differs not much from this, which is performed by a Pestil. To wit, the Pestil is wrapt up with some soft Swathe, and is thrust between the side and the head of the shoulder, but it must be of that length that the man standing may almost hang upon it; but if it be shorter, let the man sit so that he can scarce cast his shoulder over the Pestil, then let the shoulder and arm be extended along the Pestil, but let another force his body the other way, flinging his hands about his Neck neer the Throat; but this way is not so safe, whenas the Pestil under the Arm may easily give way, and there is danger lest that the body slide to this or that part upon extension made on both sides.

the fifth way

The fifth way seems more commodious, which is done by putting under a shoulder, (they cal it Subhumeration or under-shouldering) after this manner; let a strong servant and of tal stature put the pit of the Patients Arm over the sharp part of his shoulder, and let him draw the luxated shoulder towards his Breast most quickly and strongly, that the Patient may as it were hang on his shoulder, by which means both the Arm wil be extended and the head of the Shoulder moved to the fore part; in the interim let another Servant standing at the back of the Patient press the top of the shoulder that the shoulder-blade follow not with it; let him shake it, and so rule those violent motions with his hands that the luxated Shoulder be reduced into its Cavity ingraved in the shoulder-blade. If the Patient be light, let a Boy or some other heavy weight be hanged at his back; lest upon the extension of the Shoulder the whol body do follow, and al the operation of the Chirurgeon be hindered.

the sixth way

A new way of reducing the shoulder

The sixth way, which by *Hippocrates* is counted the most commodious, is described by him, *1. de artic. tex.* 19. which *Ambrose Parry* makes yet more commodious, *l.* 15. *c* 27. which may be seen there: to which way yet some Art may be added, if the Patient sit immovable on a bench, and there be two pieces of wood four or five fingers broad, two fingers thick; one being erected perpendicular must be fastened to its Basis, which must be fashioned to the form of a Cross, of that length that if it be set on the bench on which he sits, it may almost reach under his Arm-pit, which in the upper part must have a point according to its longi-

tude, into which the other may be put; but let the other be almost three Ells long, and at one end let it have another piece of wood prefixt across almost half an Ell long. Let this wood be a little hollowed an Ell long from its end to which the other wood is prefixt, that it may be inserted to the other piece of wood that is erected, but with the other end touch the bench. Now let the Patient sit unmoved on the Bench, and let that long piece of wood resting on the other erected perpendicular be so moved to him that that cross piece of wood may be straightly set under the Arm-pit of the Patient, in which part the Luxation is; let the Patient extend the Arm that is hurt upon that cross piece of wood towards the bench; then let a swathe or rope be cast about the affected Arm about the Elbow (a long Towel is most commodiously used) and let the Arm be wrapped with it til below the Elbow, so that the swathe end in two handles, on each side of the Arm and cross piece of wood; now let the drawing Engine which rests on the bench, such as are used to draw up cross bones, be applied to the end of the cross piece of wood; for which cause let that cross piece of wood with a wooden stake be driven in a cross not far from the end, and the two hooks of that drawing instrument in its upper part be laid hold on with the two handles of the rope or towel; which when 'tis done that Engine must be brought about, as is wont to be done in binding of a bone. For so the Arm is extended by degrees, and is drawn downwards, and the joynt fallen forth is promoted into its place, into which it is drawn and slips either of its own accord by the motion of its Muscles, or by help of the Chirurgeon it must be forced thither with his hand.

Which way differs from the draft of the *Ambi* described by *Parry*, in this; first of al that instead of the Pillar B. made with two pieces of wood, here is a pillar of one piece, which in its upper part hath a point, which is sent into the bosom of the *Spatha* A. hollowed in the lower part; next of al in place of that *Spatha* or *Ambi* there is a piece of wood which reacheth from the Shoulder even to the Bench on which the Patient sits. Thirdly, because that *Spatha*, which is put under the Shoulder hath not a round head, but a cross piece of wood prefixt, which is sent under the Arm-pit. Fourthly, because the Arm is not bound to the *Ambi* or *Spatha*, but only lies upon it, but the swathe which is cast upon the luxated Arm on both sides of the Arm is made fast beneath to that drawing Engine.

For brevity sake we omit many more waies of reducing which present themselves every where in Authors: and of these we have now reckoned up, and others, we may sometimes use this, sometimes that, as they are ready and at hand; for it is not safe to defer the reducing long, til more laborious Instruments are acquired.

The shoulder luxated to the fore part

If the Shoulder be luxated to the fore part, 'tis restored almost the same waies as when 'tis fallen into the Arm-pit, to wit, by extending the Shoulder, and drawing its head up and down, and forcing it into its Cavity: It differs only in this, That in this kind of Luxation the shoulder being drawn downwards must be driven to the hinder part; but the Chirurgeon must have a diligent care, lest the head of the shoulder in the action do fal down into the Arm-pit, which may be done if the Arm-pit be filled up with a bal or some round thing of a just bigness; and this operation may be facilitated by a servant standing at the back of the Patient, and with a rope or strong and broad swathe drawing upwards the shoulder-blade, lest that follow upon the extension of the shoulder made by the Chirurgeon.

The shoulder being reduced, Medicines that do hinder Inflammation and strengthen the relaxt and soft Ligaments must be applied; of which we made mention in the precedent part concerning Fractures, and above Chap. 1. of Luxations in general: the most convenient way of swathing is if a bal made up of Linen or course flax, and dipt in convenient Medicines, be put under the Arm-pit, that the head of the shoulder return not thither; let the first swathe be here, afterwards let it be rowled once or twice about the joynt; hence let it be brought to the shoulder-blade, and again descend to the joynt: at last that it may draw the Arm the more upwards, and keep it so, let it tend to the neck on the other side, and there be bound, neither let it be loosened before the third or fourth day, unless an Inflammation command otherwise. But the swathe being taken off, or laid on, some Cerote must be applied, viz. *Diapalma* if it be Summer, or if it be Winter, *Barbarum* or *Oxycroceum*.

The loosening of the tops of the broad bone of the shoulder blades

Last of al, we must not pass by here the Luxation of the top of the broad bone of the shoulder-blade, of which *Hippocrates* 2. *de artic. tex.* 62. hath these words: *But in those in whom the top of the shoulder is pulled off, the bone which is pulled off is seen to stick out. But the bone is that which joyns together the throat and shoulder-blade, whenas in this part the Nature of man is different from other Creatures, Physitians therefore are wont to be most of al deceived in this wound; for when the bone pulled off sticks forth, the upper part of the shoulder appears low and hollow, that they use the means as if the shoulder were fallen out: truly I have known many Physitians in other things good enough, who whiles they endeavor to reduce such shoulders, thinking they were fallen out, have caused much hurt by troubling them, and have not given over til they have changed their opinion, or thinking they had reduced the joynt*

joynt they knew not what they should do more; the Cure of these is this, as to others of the like sort, a Cerote, Bolsters, Linen Clothes, and Swathing made after this manner: the bone sticking out must be forced downwards, and on that part many Bolsters must be laid, and they must be prest down very wel, and the Arm must be fastened to the Ribs towards the upper part and kept so; for by no means whatsoever can it be done, that the bone pul'd off can come close and grow together; yet we must wel know, and foretel also that these things are safe, if you would have it otherwise, because neither smal nor great hurt happens to the Shoulder by this Wound, only the place becomes more deformed. For whenas neither this bone can be restored to its ancient seat, after the same manner as it was by Nature, but it must needs be that it becomes little or much strutting out at the upper part; neither doth any thing else return wholly into the same state, which communicating and cohering with another hath been pul'd off from its ancient coherence. In a few daies the pain at the top of the Shoulder is asswaged, if it be bound down rightly. Thus much *Hippocrates*; see *Galen* also in his Comment.

Chap 7. *Of a Luxation of the Elbow and* Radius.

THe Elbow and *Radius* are joyned with the lower head of the Shoulder. The Elbow by a *Gynglymus*, that is, by that kind of Articulation in which the bones joyned together do mutually receive and are received by one another; for the Shoulder hath in its lower part two bosoms, the former or lesser of which receives the outer process of the Elbow; but the hindermost or greater is devoted to the hinder process of the same; but for receiving of the *Radius* the Shoulder hath also a peculiar head, called the outer head.

The Differences.

From which we may easily collect, that the Elbow may not only be wholly and perfectly luxated, but also may suffer a subluxation: next of all that it may be luxated into al the four Differences of place, forwards, backwards, outwards, inwards; but the *Radius* as sometimes it follows the Elbow luxated into any part, but sometimes staies in its place; so sometimes it alone fals from the Elbow, without any luxation of it.

The Causes.

As the Luxation of other parts proceeds from violent Causes, so this also; and indeed the Luxation of the Elbow to the fore part (for the most part) is from a violent and sudden extension of the Arm; to the hinder part, from a violent bending of the Arm, and outwardly or inwardly, from a perversion of the Arm; the Causes of a subluxiation are humors flowing to the Joynt, which by degrees do fil up the Cavities engraved both in the lower part of the Shoulder-bone, and also in the Elbow and *Radius*, and do thrust forth the Elbow or *Radius* out of their seat.

The Signs Diagnostick.

It is easily discovered by the Sight and Touch into what part the Elbow is luxated; for if it be fallen to the fore part the Arm is extended and cannot be bent; in the fore part there is seen an unusual Tumor, but in the hinder part an unusual Cavity; things contrary to these do happen, if it be luxated to the hinder part; to wit, the Arm is crooked, and can by no means be extended; the Tumor appears in the hinder part, but the Cavity in the fore part. A Luxation to the outward part makes also a bunching out in the outer part, but a bosom in the inner part; but on the contrary, if the Elbow be fallen to the inward part, there is an eminency less then should be in the inward part, and a Cavity in the outer part.

If the *Radius* follow the Elbow, 'tis known by the same Signs; but if it only depart from the Elbow without a Luxation, a gaping and disjoyning shews it, the place is hollow, and 'tis easie to find a bosom with the Finger.

Prognosticks.

1. The Elbow as it doth not easily fal forth by reason of its firm and fast coarticulation with the Shoulder, and its plenty and strength of Ligaments; so being fallen forth it is hardly restored.

2. The Elbow luxated unless it be most speedily reduced, doth not only bring divers and dangerous Symptoms, to wit, a most exceeding pain, Inflammation, Fever, Convulsion, but sometimes also Death.

3. Of all Luxations which happen in the Gibbous part of the Elbow, the most dangerous and painful is that which is to the hinder part. *Paulus Ægineta, de re medic. l. 6. c. 115.*

4. When the Bone of the Elbow is divided from the other Bone, it is not easily restored; for neither do two bones, which are joyned together, when they once gape, easily return to their ancient place; but it must needs be, that the Bones being so divided, the part becomes swelled, and the bones are quickly compast with a *Callus*.

The Cure.

The Elbow being imperfectly luxated (or subluxated) to the fore part is most easily restored by moderate extension and only bending of the Arm, but a perfect Luxation is harder to be reduced, and requires greater provision; for first there must be extension made and that obliquely (lest the high brow of the Elbow hurt the head of the Shoulder) by two Servants, one of which must draw the top

of

of the Shoulder upwards, but the other the Elbow downwards, either with their Hands only, or if need be with Reins; then some round body must be placed by the brawny part; over which afterwards the Chirurgeon bending his Arm, and suddenly forcing the Elbow to the hinder parts, may restore it into its place.

Hippocrates 3. *de fractu.* affirms that he hath sometimes cured the Elbow luxated to the hinder part, only by a sudden and continued extension of the Arm; which if it suffice not, convenient extension being made the Elbow must be driven inwards.

The Elbow fallen forth to the outer or inner part is most easily reduced, if extension being made, it be forced from that part into which it is fallen, into the contrary.

The same manner of reducing is to be observed in replacing the *Radius*, if it hath followed the Luxation of the Elbow; but if it be only departed from it, it must be prest with the prominent parts of the Hands, and the Arm must be reduced to the natural figure; it being reduced convenient Medicines must be applied, and it must be bound up fitly, as was said in general before, *c.* 7.

Chap. 8. *Of a Luxation of the Hand and its Fingers.*

HEre by the name of Hand we understand the Wrist, and After-wrist; but the Wrist is joyned with the Elbow bone and *Radius* by a *Diarthrosis*, whenas there is a manifest motion; but with the After-wrist, whenas there is no manifest motion, by a *Synarthrosis* or doubtful articulation; the *Metacarpium* or After-wrist is joyned again with the bones of the Fingers by a *Diarthrosis*, because the round heads of the four bones of the After-wrist do conspicuously enter the superficies of the first bones of the Fingers, lightly hollowed; and after this manner also, the bones of the Fingers themselves are joyned one to another.

The Differences.

Whence we may easily collect, that the Wrist may be luxated into all four parts, to wit, the fore, the hinder, and to the sides: all the bones of the After-wrist indeed are luxated inwards and outwards, but the falling of the two middle bones to the sides is hindred by the two extream bones that have respect to the little and Fore-finger, the which two only may fall forth to that side which is free from bordering bones. The bones of the Fingers again are luxated four waies, to wit, inwardly, outwardly, and to the sides.

The Causes.

The Cause of the Luxation of the Wrist, After-wrist, and Fingers, as of other luxations, is some violent Motion, Blow, Fall, Perversion, and Contorsion.

Signs Diagnostick.

The Signs of all parts of the Hands luxated are almost common; for whether the bones of the Wrist, After-wrist, or Fingers be luxated to the fore part, a Tumor appears at that place in the fore part, and the Fingers cannot be bent.

If they be fallen to the hinder part, a Tumor also is perceived in the hinder part, and the Fingers by reason of the compression of the Tendons and Nerves going to them cannot be extended.

But if a Luxation be made to the sides, a Tumor appears in that part into which the fall is made; and a depression into that from which the Joynt is fallen.

The Prognostick

The Luxation of these parts is not dangerous, whenas they may easily be restored into their place.

The Cure

The bones of the Wrist, into what part soever they be luxated, may be without any extension at all reduced into their place, after this manner; let the Hand of the Patient be placed upon a Board or Table, and that with the palm downward if the luxation be to the hinder parts; but with the back downwards, if it be to the fore parts; afterwards let the Chirurgeon most strongly force the luxated Joynt to the contrary part, either with the palm of his Hand in more tender bodies; or with his Heel, in bodies that are stronger.

The same rule is observed in replacing the bones of the After-wrist and Fingers, except that some servant holding with one Hand the Fingers, with the other Hand the Arm; doth make a light extension; the bones being reduced, Medicines that hinder an Inflammation and strengthen the Joynts must be applied, and the part must be conveniently bound up and placed.

Chap. 9. *Of a Luxation of the Thigh.*

THe Thigh-bone, the longest and greatest in the Body of Man, at its upper part with its head sufficiently great, thick, and exactly half Globous, is not only most exactly half joyned by an *Enarthrosis* to the bosom of the Hip sufficiently large and deep to receive this head, but also is most strongly united to it by a most firm Ligament arising from the bosom of the Hip, and implanted into the narrow bosom of the head of the Thigh, to the end that the Thigh might by so much the easier and more readily be bowed, extended, moved to the sides, and turned about, and not easily slip forth.

The

The Causes.

The Causes of a perfect Luxation of the Thigh are the same as of the Luxation of the Shoulder, to wit, external and violent, a fal, a blow, or some other violent and indecent extension and distorsion of the Thigh; but the causes of an imperfect Luxation are the humors flowing to this joynt, and by degrees thrusting it out of its seat.

The Differences.

But this joynt fals forth to four parts, the former, hinder, but seldom, whenas the brow of the Cavity in this part is higher;) to the outer and inward part most often, whenas at that place the brow is lower; and sometimes the Thigh admits of a Subluxation from an internal cause; whence when *Paulus Ægineta, lib. 6. de remed. c.* 118. writes that the Articulation of the Hip doth only suffer a Luxation and not a Subluxation, that is to be understood of that only which is from an external and violent cause; for we see oftentimes that by a flux of humors some have the Ligaments in the Thigh relaxt and mollefied, that they cannot retain the head of the Thigh-bone firmly in its Cavity, whence follows a certain Subluxation.

Signs Diagnostick

the Diagnostick signs of a thigh luxated to the fore part.

If the Thigh be luxated to the fore part, a Tumor appears about the Groins, whenas the head of the Thigh leans to the *Pubes*; the Buttocks on the contrary, by reason of the Muscles contracted with the Thigh to the *Pubes*, seem wrinkled; the Urine is suppreſt by reason of the compression of the bladder by the head of the Thigh, the external Thigh can neither be bent nor brought to the Groin, whenas the head of the Thigh is in the very bending place; the man is also in pain if he be forced to bend his Knee, by reason of the former Muscle, which ariseth from the bone which belongeth to the Loyns; for that is compreſt, and being retcht is lift up by the head of the Thigh, and whenas it can be no further extended, it resists; otherwise it equals in length the whol found Thigh to the Heel; for the Thigh going forth of its Cavity comes to the fore part and a little lower, by which it comes to pass that the Thigh hurt equals the length of the found one, which especially fals out so at the Heel; the Toes of the Foot cannot easily be extended, nor turned to the ground, whence in walking the Patient is compelled to tread only on the Heel. But in them who at strong age have this joynt fallen forth into this part, and not restored, they when the pain ceaseth, and the joynt is accustomed to be contained in that place into which it is fallen, can forthwith go upright without a staff, and wholly upright; for by reason of the inflexibility of the Groyn they use the whol Thigh more straight in going, than when it was found; sometimes also they draw their foot upon the ground, whenas they cannot easily bend the upper junctures which are at the Groyn and Knee, although they walk upon the whol foot; but in those at whose tender age this joynt fallen forth is not restored, their Thigh-bone is more diminished than that of the Leg or Foot, but the Thigh is little diminished, only the flesh every where is abated, especially at the hinder part.

to the hinder part.

If the Thigh-bone be luxated to the hinder part, there are contrary signs to those mentioned, to wit, The Head of the Thigh being fallen to the Buttocks is discovered by a Tumor about those parts, both by the sight and touch: the Groyns on the contrary appear more loose; the affected Thigh by reason of the compression and distension of the Muscles compassing the head of the Thigh cannot be extended, and 'tis rendered shorter than the found one; the heel doth not touch the ground, whence the Patients can neither stand nor go, but fal headlong backwards, because the body slides to that part, and the head of the Thigh being out of its proper place is not directly opposed to underprop the body; yet the man may bend his Thigh if he be not hindered by pain; for whenas the head of the Thighs is by force with its whol neck expelled into the great Muscle of the Buttocks, which extends this Articulation, this Muscle admitting the head of the Thigh fallen forth is most of al tormented, whenas 'tis distended and preſt under it, and of necessity must be seized on by an Inflammation; but in process of time, when this Muscle is freed from an Inflammation, and contracts a certain glutinous humor, that part of it which toucheth the joynt grows to a Callus, and the Knee is bent without any pain; moreover the head of the Thigh being luxated to the hinder part, the Thigh and Foot appear moderately straight, and do not incline much one way nor other.

But when in ripe age the Thigh-bone fallen forth is not restored, when the pain is ceased, and the joynt accustomed to be turned in the flesh, the man indeed may walk, yet he is forced to bow very much towards the Groyn when he walks, and that for two reasons, Because the Thigh is rendered much shorter, and the heel is far off from touching the ground; for if he try never so much to stand on that foot, leaning upon no other thing, he wil every where fal backwards; but if in tender age this joynt luxated after this manner be not reduced, the Thigh-bone is made short, and the whol Thigh is spoiled, and is less increased, and made slenderer, being for no use.

To the outer

If the Thigh be luxated to the outer part, it is known by these signs; Between the *Anus* and Cod there is seen a Cavity and leanness; on the contrary

in

in the buttocks a certain Tumor; the Thigh by how much the head of it is fallen forth to a higher place, is rendered shorter; the Knee with the Leg looks inwards: the Heel toucheth not the ground; whence when the Patient would walk he goes only a tiptoes.

And if in those of ripe age this Joynt be not restored, but the flesh into which the Joynt is fallen grows callous, and the pain therefore ceaseth, they may go without a Staff; and therefore when they use their Thigh, in these the flesh is less offended; but they to whom in tender age this misfortune happens, require a diligent care; for if they be neglected, the whole Thigh becomes unprofitable, and is little increased; the flesh also of the whole Thigh is more abated, then in the sound one.

to the inner. Lastly a Luxation of the Thigh to the inner part is known this way; the Thigh is longer if it be compared with the other, and that for two reasons; for the head of the Thigh sticks to the bone which proceeds from the Hip upwards to the *Pecten*, and the neck of the Joynt is sustained in its Cavity; again on the outer side the buttock appears hollow, because the head of the Thigh is fallen to the inner part; and the Thigh towards the Knee is forced to look outwards to the outer part; in like manner the Leg and Foot, whenas in all luxated bones one extreamity alwaies looks to the contrary part to that which is fallen forth.

They whose joynt is fallen forth after this manner, and not reduced, when they go they wheel about their Thigh outwardly; for whenas the faulty Thigh is made longer, and by reason of weakness they cannot readily bend the bone, and by reason of pain they refuse to do it, it remains that they must bring it about.

See more of these things in *Hippoc.* 3. *de artic.* from *t.* 68. to *t.* 105. all which for brevities sake I would not transcribe hither.

Prognosticks.

1. There is great danger in the Thigh, lest that it be hardly reduced, or being reduced that it fall out again. *Celsus l.* 8. *c.* 20.

2. An old Luxation of the Thigh, which hath already contracted a callus, and in which the bosom is filled up with humors, is judged incurable.

3. If by reason of the plenty of the humor collected in the Cavity that Ligament be preternaturally extended, that it cause the Thigh to be moved out of its seat, or if the same Ligament be so relaxt by the humor that it cannot contain the bone in its seat, although the bone be reduced yet it staies not in its place, but fals out again, viz. if the humor remain; but if the humor be dried up, the Joynt may remain in its seat, of which *Hippocrates* 6. Aphor. 60. *They who being troubled with a long continued pain of the Hip have the head of the Thigh fallen forth of the Hip, their Thigh wasteth, and becomes lame unless they be burnt.*

4. The same comes to pass if that Ligament be broken.

5. If the luxated Thigh be not reduced, the neighboring parts are wasted by degrees, for both the Arteries and Veins are streightened and compresst, that there is not a free passage open for the blood and spirits to those parts; and because the part is not moved after its due manner, the heat fadeth, whence the nourishment of the part is not rightly accomplisht, and the Thigh-bone is not encreased according to the proportion of the rest of the bones.

The Cure.

Whereas after the same manner almost as the Shoulder is joyned with the Shoulder-blade, so the Thigh is with the Hip-bone, so the way of reducing them both is almost the same. The Patient must be placed upon a Bench or Table, putting a Pillow or Bed under him, with his Face downward if the Luxation be made outward or backward, with his face upwards if inwards, and upon his side if forwards; and this reducing is done sometimes only with the Hands without any extension; as first of all either let the head of the Thigh be so long wheeled about the Loyns till it come into its Cavity (which way notwithstanding is not so safe) or secondly (to wit, in a Luxation made to the inner part) let the Thigh most quickly and strongly be bent to the Groyns, and by this means let the head of the Thigh fallen forth be forced outward into its place; but if no good be done by these waies, the Patient must alwaies be so placed, that the part into which the head of the Thigh is fallen, be uppermost, but that from which it is departed, lowermost; afterwards convenient extension must be made, and at length the Thigh must be forced into its Cavity alwaies a way contrary to its falling forth; but how a lawfull and convenient extension is to be made, either with the hands, to wit, in soft bodies a new luxation; or with Reins, Ropes, and the like, to wit, in strong bodies and an old luxation, doth sufficiently appear from those things which are said in the precedent part, *c.* 11. of the Fracture of the Thigh; and truly the extension may be common to the four species of a luxated Thigh; but the manner of forcing and restoring the head of the Thigh into its place varies according to the variety of the parts to which it is fallen: for that which is fallen inwards must be forced outwards, that outwards, inwards, and so of the rest; when the bone is reduced, which is known by the free motion of the Thigh and without any pain, the Medicines of which we spake formerly in general, *c.* 1. must be laid on the Joynt, and with rowling the Joynt must be kept in its place; straw beds also as in Fractures must be applied, and both Thighs be

be kept in its place; straw beds also as in fractures must be applied, and both Thighs be bound that the luxated Member may be kept in its place; and this provision must not be loosed before the fourth day; and let the Patient keep himself long enough in bed, nor let him walk, lest by unseasonable walking the bone fal forth again.

See more in *Hippocrates*, *Paulus Ægineta*, *l.* 6. *c.* 119. *Ambrose Parry*, *l.* 15. from *c.* 39. to *c.* 48.

Chap. 10 *Of a Luxation of the patel Bone*

THe Thigh in its lower part hath two eminent heads tending to the hinder part, with which it is inserted into two bosoms of the leg-bone, only superficial ones, and no waies deep, and pargeted over with a smooth cartilage; it hath moreover in its hinder part a certain bosom, into which the bunching forth of the Leg-bone that stands forth betwixt its two bosoms is inserted: but lest that by reason of this looser Articulation, which is by a *Ginglymus*, the Knee should be subject to frequent Luxations; on the fore part the patel bone is set over the bone of the Thigh and Legg, and firmly joyned to them by benefit of the thick Tendons of the Muscles extending the Leg; besides on the out side of the greater bone stands the Bracer, which at its upper part in the inner side hath a bosom covered with a Cartilage, by which the little side head is received, which subsists at the upper Appendix of the great Bone; but at its lower part, with its acute angle 'tis inserted into the external and oblong bosom of the lower Appendix of the great Bone, and makes the outward Ankle: whenas therefore here concur many Articulations, also many Luxations may happen.

A Luxation of the Knee-pan

And truly first of al, The Patel Bone whenas it hath no obstacle on the sides hindering its dislocation, may be most easily luxated, to the upper, lower, outward, and inner part, but never to the hinder part, in regard that the bones of the greater Focil and Thigh which it covers do hinder it.

The Causes.

The Causes of this Luxation are, a fal from on high, jumping, blows, and an undecent distension of the Leg.

Signs Diagnostick.

The Luxation of the Patel Bone is easily known by the sight and touch, and the Thigh cannot rightly be bent and moved.

Prognosticks.

Whenas this Articulation is more loose, the Patel Bone may easily be restored to its seat.

The Cure.

That the Patel bone may be reduced into its seat, let the Patient stand firmly upright upon a place; but let the Chirurgeon with his hands force the Patel Bone from that part into which it is fallen, to that from whence it is fallen; when the Bone is restored to its place, fit Medicines must be laid upon it, and the hollow of the Knee must be filled up with Bolsters that the Thigh cannot be bent; then a hollow piece of the figure of the Patel Bone must be placed about it, especially on the side to which it fel, that the Patient may not bend his Knee. When there is no more danger lest the Patel Bone fal out again, let the Patient by degrees accustom to bend his Knee again.

Chap. 11. *Of the Knee Luxated.*

THe Knee may not only be Subluxated, but it may suffer a perfect Luxation; and truly oftentimes fals to the inward and outward part, seldom to the hinder part, but seldomest of al to the fore part, and not unless from a most violent cause, in regard that the opposition of the Patel Bone doth hinder it.

The Causes

This Luxation also happens from blows, fals, jumping, vehement running, and an uncomely extension or contraction, and distorsion of the Legg.

Signs Diagnostick.

To what part the Knee is Luxated is easily known; for in the side to which the joynt is broke forth a bunching out, but a Cavity in the side from which it is departed is discoverable both by the sight and touch: its figure is depraved, the Thigh is extended and cannot be bent, whence the motion is necessarily depraved, or wholly lost.

Prognosticks

1. The Knee if it be compared with the Elbow, the joynt in the Knee, by reason of its manner of juncture, oftener fals out, and is easier reduced. For the structure of the Bones with which both joynts are contained is more straight in the Elbow, more loose in the Knee; besides, many processes and many bosoms joyned to one another do every where bind up the joynting of the Elbow, but in the Knee the bunchings forth of the Thigh are cast into the smal Bosoms of the Leg.

2. For the same cause a Luxation of the knee is less dangerous, nor doth an Inflammation easily happen; for whenas an Inflammation ariseth from the force with which the bones are expelled and reduced again, and the pain arising from hence, because in the Knee the joynt may fal forth and

be reduced without any great force, there is no fear of an Inflammation.

The Cure.

The Knee luxated to the inward and outward part is not hard to be restored by moderate extension made, either with the hands in a new Luxation and childs body, or with rems in a Luxation not so late, and stronger bodies; and with forcing the bones with the hand into the contrary part from which they fel.

But a Luxation made backwards is commodiously restored, if the Patient be placed with his Face on a Bench, and some servant put a Linen Globe into the hollow of the Ham at what part the Bone sticks forth, and strongly force the bone fallen forth towards the fore parts; but let the Chirurgeon take hold of the lame Leg with both hands, and of a sudden so bend and bow it that his Heel touch his Buttocks.

A Knee Subluxated by none or very little extension made, and forcing it to the contrary part is reduced into its place.

When the Bone is reduced, which is known by the free extension of the Leg, and comparing it with the other Knee, convenient Medicines must be laid upon it, and binding up must be ordered, and the Patient must forbear going til there be no more fear of a new Luxation.

Chap. 12 *Of the Distraction of the Bracer.*

THe Bracer adheres to the greater Bone of the Leg, and as it was said in the former Chapter, above to the Knee, below the Ankle; but 'tis drawn from the great Bone three waies, to wit, To the fore part, and both sides.

The Causes.

But this Divulsion comes from those Causes from which we said the Knee was luxated, especially when walking in a slippery place the foot is not firm, but dubiously is wrinched inwardly or outwardly; the same may be by a fal from on high, or by a blow.

Signs Diagnostick.

A Tumor appears in the part to which the Bracer is distracted, and is discovered by the sight and touch; and motion is hurt.

The Prognostick

The reducing of the Bracer is easie.

The Cure

For by the hands of the Chirurgeon it may easily be compelled and brought back into its seat by forcing it into that part contrary to its fal: afterwards convenient binding up must be ordered, putting bolsters to that part to which the Bracer is fallen; and rest for some weeks must be commanded the Patient, til the Ligaments are confirmed again.

Chap. 13 *Of a Luxation of the Foot and its Bones, and of the Toes.*

BY the word *Foot* we understand al that part of Mans Body reaching out from the lower part of the Leg to the very ends of the Toes, which contains divers Bones after divers manners joynted together, and united by Membranous Ligaments, to wit, The Ankle, the Heel, the Ship-like Bone, the *Tarsus*, *Metatarsus*, and Bones of the Toes; of the Luxations of al which we should now speak; but because the Bones of the *Tarsus*, *Metatarsus*, and Toes, are here united almost after the same manner as the Bones of the Wrist, after-Wrist, and Fingers are to one another, they are subject also to the same Luxations, have the same causes, are known by the same signs, and are reduced the same way; but the ship-like bone may suffer the same things as the Bones of the *Tarsus*; it is not worth our labor to add much of these, but those things which are said of the bones of the Hand may also be applied to these. Some things only we shal add of the Luxation of the Ankle and Heel, whenas no Bones in the Hand do answer unto these.

Luxation of the Ankle and Heel

The Differences.

The Ankle joyned with the greater and lesser focil by a *Ginglymus* may be luxated perfectly and imperfectly to every part, to wit, The outward, inward, fore, and back part.

But the Heel lying under the Ankle is often moved indeed more forward and backward, but seldom to the sides.

The Causes.

The Luxation of these parts is from a violent fal, a blow, or some other inconvenient distorsion of the Foot. But in particular the Heel is luxated, and pulled from the Ankle, if one leaping from on high do fal and stick heavily upon the Heel, or in dancing doth insist much upon the Heel.

The Signs Diagnostick.

The Ankle if it be fallen to the outward part, the lower part of the Foot is turned inwardly; if to the inward part, there are contrary signs; if it be luxated to the fore part, the broad Tendon stretcht under the Heel is hard and retcht, and the Foot is less and shorter; if to the hinder part, on the contrary the Heel is almost hid, the Soal

seems

seems to become greater, and the Foot longer.

A Luxation of the Heel is easily known by the pain, the figure of the part depraved, and its action hurt.

Prognosticks.

1. The Ankle as 'tis easily luxated, so 'tis easily also reduced; but by reason of the multitude of Bones making up the joynts 'tis hardly confirmed.

2. A Luxation of the Heel is most dangerous, because the Veins, Arteries, and greater Nerves which it receives, and also the Tendon which is joyned to it, are easily drawn into consent; whence may be raised, Ravings, Tremblings, Convulsions, Feavers, and many other evils.

The Cure.

Let a Commodious extension go before the reducing of the Ankle; whether it be done by the hands of Servants, one of which must hold the Foot, the other the Legg; or with reins or other engines that draw downwards; afterwards let the Chirurgeon force the joynt to the contrary part from which it is fallen, and order a convenient binding up. The Patient in this Luxation must be kept longer in his bed, that the distended Muscles and the Ligaments which are rendered more loose may acquire their just strength, and may be fit to bear the whol body, which scarce happens before the fortieth day.

The Heel also upon light extension made is reduced to its ancient place; being reduced it must be so bound up that the humors abounding may be driven from it to other parts; the Patient also must be so long kept quiet, til this joynt restored be wel confirmed.

OF THE FRENCH POX.

CHAP. I.

Of the Name and original of the Veneral Diſeaſe.

AMongſt contagious diſeaſes, next to the Peſtilence, and Leproſy of Arabians, the French Pox doth challenge the firſt place; but it is called by ſeveral names: the moſt common name is the French Pox, which was therefore impoſed, becauſe it firſt of al in Europe appeared amongſt the French. For in the yeare of our Lord 1493. and 1494. When *Charls* the Eighth, King of *France*, warred with King *Alphonſus* at *Naples*, this diſeaſe firſt appeared and began to rage in the Camps of the French, and therefore by the *Italians* was firſt of al named the French diſeaſe. For whereas *Antonius Benivenius de abdit. morb. cauſ. cap.* 1. relates that it happened in the year of our Lord 1496. that doubtleſs is thus to be underſtood, That now this diſeaſe did no longer contain it ſelf in *Italy*, but as he ſpeaks, had almoſt ſpread over al Europe, and began to diffuſe it ſelf abroad through the reſt of its provinces; for al other Authors agree in this, that this diſeaſe did firſt of al appeare at the foreſaid time in the French Camp at *Naples*, and there was called the French diſeaſe. But the French that they may remove this diſgrace from themſelves, and retort the injury upon the Italian, cal it the Italian, and Neapolitan diſeaſe, becauſe it was firſt known in *Italy* at *Naples*. Others becauſe it was brought by the Spaniards into the Fench Camp, cal it the Spaniſh diſeaſe, and others the Indian, for the writers of the Indies do report that in that part of *America*, whoſe longitude ends towards the North, and which they cal *Florida*, this diſeaſe many ages ago was epidemical; and they write that it did generally invade, and ſuddenly ſeize on many without any manifeſt cauſe, without contagion, and eſpecially if any one had copulation with a woman in the time of her Courſes. *Fracaſtorius* cals it Syphilis, ſome the gout of the privities, ſome the great Pox, becauſe puſtles and ſwellings do every where break forth like thoſe of the ſmal Pox. Moſt men now adays without any injury or diſgrace to any Nation, do cal it the Veneral diſeaſe, becauſe it is chiefly contracted by a contagion from Venery, and lying with unwholſome bodies.

But Authors are wont here to make this Quærie, Whether that diſeaſe ſprung up at *Naples* about the yeare 1494. were a new diſeaſe, or whether it were known to the Ancients? *Franciſcus Valleſius.* 1. *Epidem. com.* 1. And *Hieron Ruſnerus de Scorbuto exercit.* 1. and the ſome other moderns, are of opinion this diſeaſe was unknown to the ancients, and they think that *Hippocrates* did not ſhadow it

Whether it be a new Diſeaſe.

out

out by his pencil, but set it forth to the life in 3 Epid. Sect. 3. (they are the words of *Reusner*) whenas he reckons up there divers symptomes, which are seen in the veneral disease; as imposthumations and suppurations of the flesh, the lying bare of the nerves and bones, and great fallings forth, fluxions collected not like unto matter, but far worse, a baldness of the head and chin, with and without a Feaver, St. Anthonies fire with smal Ulcers and inflamation, filthy and putrid fluxes, pains of the limbs, swellings about the jaws, inflamations of the tongue, impostumations, about the teeth, stammering, corrupt, and perplext speech, enterings into consumptions, burning Feavers, and which is worst of al, ulcers about the pubes and privities.

But *Hippocrates* in that place never so much as dream'd of the Veneral disease, but describes a most grievous pestilence, according to the judgment of *Galen* and al interpreters, and the evidence of the History it self witnessing the same. For that disease for the most part invaded with a Feaver, which is not so in the Veneral disease and was epidemical, whenas the Veneral disease is disseminated only by contagion, and no other way, and the method of curing that disease was far different from the cure of the veneral.

Dodoneus also hath observ'd upon the alleaged place of *Benivenius*, that a long time agoe some men have contracted some hurts from uncleane and filthy women, as *Guilielmus Salicetus*, *Gordonius*, and *Vallescus de Taranta*, do testify, the last of which lived in the year 1418. but *Salicetus* flourisht in the yeare 1270. *Gordonius* in the time between them both. Nay holy writ doth testefy that he that followeth harlots, shal have wormes and moths for his reward: but I do not think that those diseases were the same with the Veneral disease of this time which first of al appeared at the aforesaid time in *Italy* in the Camp of the French. Therefore though *Paracelsus*, *lib. de tumorib. et ulcer. morb. Gal. cap.* 3. Writes that this hapned in the yeare 1478. and *lib.* 1. *de causa luis Gal. cap.* 3. In the yeare 1480. yet he differs from the relations of al others, since al agree in this, that this disease was not known in Europe, before the yeare of our Lord 1493. although it were endemious in the west *Indies* a long while before, and was brought by the Spaniards out of *India* into *Italy*. For when *Christopher Columbus* in the yeare 1492. in the month of *September* undertook his first voyage into the west Indies, and spent almost two years in that expedition, he returned into *Spain* in the yeare 1494. whose Souldiers being infected with that disease in *India*, and afterwards serving in the *Italian* expedition, did sow amongst them this disease. For as *Gabriel Fallopius* writes of this business *de morb. Gal. lib.* 1. (Who reports his Father was in that warre) whenas the Spaniards by reason of the dearenes of provisin did drive out the unserviceable multitude, the French did privately entertain their harlots, being allured by their beauty, and so infected with their contagion contracted this disease, which afterwards was first of al spred through their camps, & hence throughout Europe.

The Original of the Veneral disease.

Yet in some Countries it hath and doth yet spred more frequently, in others 'tis more rare, to enquire into the cause whereof, it being a thing hateful we shal forbeare; yet this I think is certain, that there are fewer sick of this disease in *Germany*, than in some other Countries. *Gabriel Fallopius* makes mention *de morb. Gal. cap.* 76. Of *Jacob Carpus*, who was the first almost that used the way of cure by unction of Quicksilver, who by this cure alone grew so rich, that he left besides Silver, 40000. Golden * Scutatoes. And *Capivaccius* reports in *tract at: de lue Vener. cap.* 12. In fine, that he hath gotten by the cure of the French Pox only above 18000 Crowns of Gold. And *L. Septal. l.* 7. *animad: n.* 186. writes that at *Millaine* in *Brolius Hospital*, there is oftentimes cured seventy in the spring only, and at other seasons alwaies two hundred. But I confes ingeniously, that within these 34 yeares which I have practised at *Witeberge*, and by Gods blessing I do it not without profit, that I have not gained by the cure of this disease so many crowns,

* *A Coin.*

Crownes, as *Capivaccius* hath got thousands of them, by reason of the fewnes of them that are sick of this disease in this place.

Yet others differ concerning its original, and think that this disease was not only disseminated by contagion from the Spaniards, but think it was contracted by the fault of the Ayr, as epidemick diseases are; when as many every where in diverse countries began to be sick of this disease without any contagion; of which hereafter.

Chap. II.

A History of the Veneral Disease.

BUt concerning the original of this disease we shal speak more hereafter when we shal treat of its causes: now let us enquire into its nature, which that it may succeed more happily, and that it may appeare, where lyes the controversy, I wil first propound its description and history out of creditable Authors which then lived especially *Hieron Fracastorius*, and *Anton. Benivenius*. When this disease was first made known, there rose pustles of divers kinds in the genital parts, sometimes also the head, principally in the hairy part, sometimes also the forehead, neck, breast, duggs, armes, and other parts, and from thence did spred over the whol body, in some indeed they were flat and low, but rough on their surface, when the scales were fallen off, of a color somwhat red, and the flesh under them appeared callous; in others they were like to warts, of a round figure, which grew to the magnitude of an acorn cuppe whose figure also they resembled, and from these the lighter scales falling off did hang forth a more ruddy flesh, from wch did flow forth a virulent ichor and of a strong smel; but some were taken with larger pustles, which did not swel above the skin, which had thicker scales, from which also did flow a more plentiful virulent matter, and the scales being cast, the flesh appeared more dark and somwhat livid. Some having white scales taken off, there remained somwhat like unto a skar, from which blood sometimes flowing, did shew the difficulty of the cure, and it represented the likenes of a dry scabb, a disease worse than al the rest. For though it did corrode less, yet for spreading it was worse than the rest, and was diffused into divers places. Besides those external pustles there did rise others in internal places, as in the mouth, jawes, nose, and the obscene parts, which turned to malignant and creeping ulcers which eat away the parts under them, and in some eat up the Nose, in others the lipps, in others consumed the Uvula, and perforated the palate, which caused their voice to be hoarse; neither did this evil spare the bones, but caused rottennes in them, whence some had their skul, others other bones ful of holes. Neither did those pustles and signs of the disease appear only in the external parts obvious to the eye, but it was observed in some, that those pustles & filthy ulcers had possest their very bowels. They that had this evil about their upper parts, had vitious distillations, which did sometimes eat their palate, sometimes the jaws and tonsills, in some their nose, and in others their eyes. Furthermore for the most part certain gummosities grew on their limbs in great deformity. For oftentimes they were prominent the bigness of an egg, oftentimes the size of a Loafe, which being opened, there appeared a white mucilaginous mucous: that tenacious callus, happened most of al in the Arms and Thighs, in some it was exulcerated, sometimes it continued whole until their death. There came also cruel pains with exceeding torment, which were exasperated towards night: but those pains did shew themselves about that part of the bones where is no flesh in the Leggs, shoulder-blade, about the collar-bone, in the shoulders, head, about the forehead and temples, sometimes also in the breast bone, but not in the very joints, but about the muscles and nerves. In which case notwithstanding there was great variety. For some had pains without pustles, some pustles without pain, the greatest part was affected with both, and truly those pains sometimes went before the pustles,

somtimes followed, and sometimes rose together with them: in the interim al parts languished, the body pined away, the appetite was dejected, watchings, sadness, and continual anger, and desire of repose possest them; sometimes a smal Feavor accompanied them, but seldome: their blood, if a Vein were opened, was mucous, and corrupt, their urine thick, fat, and somwhat red without a Feavor, they went hardly to stool, and the excrements were mucous and dry. The shedding of the Hair is frequent in this Disease, especially in the Head, about the Temples, and the hinder part, also of the eybrows, and of the Beard in men; oftentimes also Buboes break forth in the groin, therefore called Veneral and Gallical, which sometimes vanish again, somtimes grow hard, somtimes suppurate; there rise also in the privities of Women knobs, and in men in their Arse-hole, besides somtimes there happen chops and clefts in the hands and feet, and the thick Skin in the palme of the hands departs from the skin under it; sometimes also the nails fal off: At last there happens sometimes, that in men a virulent matter flowes through their yard, in women through their privities, which flux of virulent matter is commonly called the Gallical or virulent running of the reins, although indeed it is not seed, by which flux of the yard, the inward passage is exulcerated, and certain caruncles do grow in the urinary passage, whence they pisse hor, and there is caused a dropping of the urine with pain. And this was the face of that disease at its first rise, wch as *Hieron Fracastorius* relates, since that time seems to be altered. For almost twenty yeares after its original there began to appear fewer pustles, but more gumosities, and the pustles became dryer, and the paines more cruel. Six yeares after again there was another change, for now there were very few pustles seen, and almost no pains, or much gentler, but many gumosities, and which seemed wonderful in al, the shedding of the haire made men almost ridiculous, some appearing without beard, some without hair on their eyebrowes, others with bald pates, from which change *Fracastorius* had good hopes, and did think that the old age of this disease was now entring, and that ere long it would come to pass, that it could not propigate it self by contagion, because the matter grew dayly thicker, in which both fewer, and weaker seminaries are produced: but his hopes did much deceive him, and this disease last even in these times, nay as some think, 'tis wel nigh worse than it was of old.

CHAP. III.

Of the Nature of the Veneral Disease.

The Veneral diseas, is from an occult quality.

SInce then so great a Hodge-podge of diseases and Symptoms appear in this affect, we must diligently enquire what the nature of it is, of which divers Authors have their divers opinions, and as *Epiphanius Ferdinandus* writes of this business, in *Hist. Med. Hist.* 17. the Authors which have writ of this Disease, although they amount to the number of eighty (and perhaps more) are al almost differing concerning the Essence of this Disease, and every one defines it at his own pleasure; for whenas this Disease was unknown to the Ancients, nor described by them, nor they had not, as is usually wont to be, the opinions of the Ancients to insist upon, every Modern using his own liberty hath propoled his own Opinion. Truly I think this is not doubted, that 'tis a Contagious, Malignant and Venenate Affect; neither doth it seem to want any great pains to prove it, for it appears sufficiently by this, that in so smal a quantity of matter, by which this Disease is contracted by contagion, there is so great force and power of action, as no first quality, or the temperament made up of the first qualities can have; and the variety of Diseases and Symptomes in this evill is so great, that it cannot be reduced to any manifest cause; therefore as in pestilent constitutions, such as that Attick one was in *Thucidides*, and that which *Hippocrates* hath described, 3. *Epid.* there was so great a multitude of evils, that they were forced to fly to occult qualities and a venenate cause; so also, there being so great a filth of diseases and symptomes in the Venerous Disease,

Diſeaſe, that the original of them all cannot be refer'd to any manifeſt quality, here alſo we fly to a malignant and occult quality.

But although theſe things be thus, yet Authors differ ſtil of this, whether that malignity conſiſt only in the cauſe, or whether there be alſo ſome malignant Diſeaſe preſent. *Capivaccius, de Morb. Gal. Cap.* 1. thinks this affect not to be the Diſeaſe, but the cauſe, while he defines the Veneral Diſeaſe, that it is an excrement wholly preternatural, able to hurt man many waies, produced out of humane ſubſtance by its like. *What it is.* *Capivaccius opinion*

Thus alſo *Hercules Saxonia, de lue Vener. Cap.* 1. writes, that the Veneral Diſeaſe is the Cauſe, not the Diſeaſe nor the Symptome, therefore, becauſe it can exiſt out of mans body in Linnen, or other ſuch kind of vertues, beſides in the ſweat, Seed, and Blood, being ſeperated from the body; but within mans Body it infects and poſſeſſes alſo thoſe parts which are not living, and are not ſubject to Diſeaſes, viz. the humors and ſpirits. *Hercules Saxony.*

Aurelius Minadous de virulentia Vener. holds that 'tis neither the diſeaſe, nor the cauſe, nor the ſymptom; not the diſeaſe for this cauſe *cap.* 17. becauſe 'tis neither a diſtemper, nor evil Compoſition, nor a ſolution of unity: but he denies it to be the cauſe of the Diſeaſe, *Cap.* 9. ſince that is properly the preternatural, the cauſe between which and the Action there fals a medium, viz. the diſeaſe whenas the diſeaſe is that which doth next of al hurt the Action, but the cauſe doth hurt it by intervention of the Diſeaſe; but between the Veneral virulency and the action hurt he thinks there fals no medium, but that of it ſelf by its own ſtrength doth primarily and immediately vitiate and hurt the operations; but that the Veneral virulency doth of it ſelf and primarily hurt the operations, he thinks this is confeſt amongſt Phyſitians, and therefore deems it to be preſuppoſed, and unleſs this virulency did of it ſelf and primarily hurt the operations, ſo many Phyſitians would not have labored in ſearching out its nature. He proves it is no Symptome, *Cap.* 18. beauſe it is no action hurt, nor quality changed, nor excrement altered. That it is no action hurt, he proves by this, becauſe the veneral virulency it ſelf is that which hurts the actions; neither is it any quality changed, becauſe the qualities changed do follow the actions hurt, and beſides ſo many diſeaſes are ſeen in this virulency which are not Symptomes. But *Aurelius Minadous* himſelf, when he had rejected al the opinions & definitions of others, at length he fits himſelf to make a perfect definition and to explain the nature of this evil. But firſt of al Chap. 16. he preſuppoſes this as the ground of his opinion, viz. that the French Diſeaſe ought not to be defined by a quality, but rather by the name of a body, for this reaſon, becauſe it paſſeth from one body to another, which is the propriety of bodies not of qualities, and becauſe it toucheth other bodies, for none but bodies can touch, and be touche again, as *Lucretius* hath it. Again, if it were a quality, it were either manifeſt, or occult, no manifeſt one, as he proves rightly by many Arguments; but that it is no occult quality he brings no ſpecial Argument, but repeats the general one, becauſe 'tis moved from place to place, and toucheth other bodies. *Aurelius Minadous.*

This preſuppoſed, afterwards Chap. 30. he affirmes the Veneral virulency to be ſomwhat corporeal internal, and truly a ſpirit or a vapor, for this reaſon, becauſe 'tis carried, commuicated, and participated in a very ſhort ſpace of time. Yet he holds it to be ſuch a vapor which is endewed with an occult quality and vertue from its whol ſubſtance, or the whol mode of its nature, by reaſon of which quality it cannot only infect any humors of the body, but alſo al parts of the body, and corrupt them & turn them to its own likeneſs: but that this evil conſiſts in a ſpiritual ſubſtance, he further proves, becauſe ſome are infected not only by the act of Venery, but alſo by a Kiſs, or the uſe of garments: next of al, becauſe ſome have felt no other hurt from this evil, than only the falling of their hair, becauſe the roots of the hairs were gnawed off by the acrid vapors. Thirdly, becauſe ſome only by vehement exerciſe have diſcuſſed this virulency. Yet he denies that vapor or ſpirit to be properly an excrement, Chap. 20. whenas that is properly an excrement, which redounds from nouriſhment, & which is caſt off from another: although he grants there

that

that is commonly called an excrement, whatsoever is superfluous in the body, whether it be a spirit, or humor, or some other solid body, whether it be usual, or unusual, whether according to nature or preternatural; furthermore he holds this vapor to be wandring, thin, and viscid, Chap. 21. and to be raised from a spirituous, humorous, solid substance: but he proves Chap. 22. by many Arguments that this vapor is contrary and preternatural by its whole substance, of which we shal speak hereafter; and at last Chap. 27. he defines the Veneral virulency, that it is a vapor by its whol substance inimicous to the natural faculty, working by degrees. And that he might unfold his mind more clearly, and not leave the Reader doubtful, to what kind of things preternatural this virulency ought to be referred, whenas he had said before, that it was neither the Disease, nor the cause, nor the Symptome, yet it primarily hurt the actions; at length Chap. 28. he holds that 'tis an externall error, and he endeavors to prove it by this Sylogisme, whatsoever doth primarily hurt the operation, and is not of the constitution of the body, is an external error, but the Veneral virulency doth primarily hurt the operation, and is not of the constitution of the body, therefore 'tis an external error.

Some that they may briefly quit themselves, and hold with al men, say that this disease is a heap of al evils, Diseases and symptomes.

The Veneral disease depends on an occult quality.

That we may clear our selves out of this difficult controversy, first of al 'tis already proved, and shal be proved more at large hereafter, that they are in the right, who do here admit of an occult quality, and a power depending on the whole substance, as they commonly speak; neither can they hold any other waies, Since 'tis without doubt, that 'tis a contagious and malignant disease while it is such. It performes two things, to wit, it alters the body by which it is received and changeth it to its owne similitude, and indeed it alters it not by the first qualities: as shal be said by and by, since it is not expeld by the first qualities; neither is that change alwaies with putrefaction, whenas putrefaction is not induced but by a long time, but this change is made in a moment as it were; neither is it an aduction as *John Baptista Montanus*, and some others do hold, whenas there is not alwaies a hot & dry distemper present, neither is it cured by cooling and moistening things, and oftentimes there is a sordid putrefaction, in which there is no exuction.

'Tis a disease.

But whereas they hold this malignity is only in that matter seated without the living parts, and that there is no such disease present, in this they erre very much. Indeed we willingly grant, that that contagious inquination, sent forth from the body infected with the veneral disease, may adhere to the garments; neither do we deny this, that the humors in our body may be tainted with the same, yet in the interim it doth scarce follow, that the living parts remain free and sound; for as in a putrid feaver, though the humors and spirits do first grow hot by the feaverish heat, yet afterwards the living parts are seized on by the same distemper, so though the humors in the Veneral disease are first infected by that occult malignity, yet there is no cause why the same fault may not be communicated to the living parts.

Not hot and dry.

But though some do acknowledg that this cause cannot be idle, yet whenas they know nothing beyond the manifest and first qualities, they endeavour to reduce also the effects of the veneral virulency to manifest causes. *John Baptista Montanus* as was said even now, thinks the essence of this evil consists in a hot and dry distemper, but the cure tels otherwise, whenas 'tis cured by hot and dry Medicines, as by the Decoction of Guajacum and the like: besides, because there is a great putrefaction in the Humors, which doth not proceed from a hot and dry distemper.

Not cold and dry.

Nicolaus Massa de Morb. Galli. Cap. 5. saith it is a coldnes of the Liver, declining to a little drines with an occult quality: but as concerning the occult quality he writes truly, but that it is no cold distemper, the effect doth teach us, as the Ulcers, rottennes of the bones, and the like; and what other distemper soever they alleage. Yet they produce nothing agreeable to the Diseases and

Symptomes,

Symptomes, which appear in this Diſeaſe, nor to the Cure.

Therefore when as the action of the veneral virulency can be referred to no manifeſt quality. We may wel ſay that by that is induced an occult quality: For firſt of al every efficient cauſe is ſaid to be a cauſe from the nature of its efficiency, and therefore this malignant quality doth not only alter and change the humors, but alſo the living parts into its likeneſs: again, though the morbifick cauſe be taken away, and this diſeaſe ſeem now to be overcome, yet unleſs that malignant diſpoſition be deſtroyed the man recovers not his perfect health. For it hath been obſerved that the Veneral Diſeaſe hath ſomtimes grown freſh after thirty years paſt, which doubtleſs happened not becauſe the Vitious Humors lay ſo long hid in the body (for theſe would have ſooner diſcovered themſelves by their ſigns) but becauſe that malignant diſpoſition impreſt on the body was actually there, which afterwards, by degrees produced vitious humors, and corrupted, and ſo broke forth into act; and *Trincavellius*, *Lib.* 11. *de curand. rat. particul. affect. cap.* 11. reports, that a certain Woman brought forth a Child ſick of the French Diſeaſe, and every where ful of cruſty Ulcers, whenas ſhe her ſelf never had any ſign of that Diſeaſe contracted, but was alwaies wholly wel, and on the contrary it may happen, that one may have a French Ulcer, which yet, when that Malignity is diſtroyed, is no longer rightly ſaid to be Gallical, but is cured by vulgar Medicines as other Ulcers. *But occult.*

Al which being thus, we conceive the the Veneral Diſeaſe, doth not only exiſt in the Humors, but alſo in the living parts, and that it doth conſiſt not only in the change of the firſt qualities, but alſo there is an occult malignant quality imprinted on the parts, and therefore the veneral Diſeaſe is to be referred to diſeaſes, and thoſe of occult qualities. Which are called by *Fernelius* diſeaſes of the whol ſubſtance, but not on every part rightly explained, as we have ſaid before, the which if *Capivaccius*, and *Saxonia* had known, the one would not have defined this evil by the excrement, nor the other by the cauſe. if the ſame alſo had been known to *Aurelius Minadous*, he would not have endeavoured to maintain that this evil was no Diſeaſe, but an external error. For whereas he endeavors to prove that the veneral Diſeaſe is not a Diſeaſe of the ſimilar parts, becauſe it is not a diſtemper, nor an evil compoſition, nor a ſolution of unity, in this proof he labors to no purpoſe, for al this we willingly grant; but this he ought to prove, that there is no other kind of Diſeaſe in the ſimilar parts beſides the diſtemper of the firſt qualities; but that there are ſuch diſeaſes, which *Fernelius* calls of the whol ſubſtance, we more rightly, of occult qualities, is ſufficiently proved above, *part* 1. and this very Diſeaſe, as all other venenate Diſeaſes do ſhew, that it can be referred to no other kind than to malignant qualities; & this follows from *Minadous* his own ſuppoſition, and confeſſion, which he hath *Cap.* 20. where he writes, that the Veneral virulency hath power not only to infect al Humors, but al parts of the body, and to corrupt and convert them to its own ſimilitude. The ſame *Minadous* if he had known theſe Diſeaſes, had not taken ſo much pains, to what kind of preternatural things the veneral virulency ought to be referred. For firſt of al there was no need of excluding from the number of cauſes, thoſe vitious Humors, which are found in the bodies ſick of the veneral Diſeaſe, and have power to alter and change the Humors themſelves and parts of the body. For whereas he ſaith, that is properly the cauſe, between which and the action hurt the diſeaſe doth interceed, that is true of the next cauſe, but the antecedent cauſes alſo may do hurt, as they have the Nature of a vitious object, and external Error: and in this very Diſeaſe whiles the virulent Humors do imprint a malignant quality on he parts, between them and the action hurt that Malignant diſpoſition and occult quality doth intercede. Therefore whereas he thinks that Humor or venenate vapour in the veneral diſeaſe, doth imediately hurt the action, 'tis falſe, unleſs that humor have the nature of an external error. For al hurt actions in the Veneral diſeaſe do happen, whiles between them and the humor, or malignant *An examination of Aurelius Minadous opinion.*

vapor,

vapor, a midling diſeaſe doth intercede, to wit, that of occult qualities.

The Veneral diſeaſe is not a Body.

But whereas he denies the Veneral virulency to be a quality, and holds it to be a body, firſt of al he confounds the cauſe and the diſeaſe, next of al he doth not diſtinguiſh between the quality and its ſubject. For whiles we ſay the Veneral evil, we underſtand either the diſeaſe it ſelf, or its cauſe: if the diſeaſe, that is a quality, as al diſeaſes are, to wit a preternatural diſpoſition of the parts, and indeed an occult and malignant quality: but if the veneral evil be taken for the cauſe, either wch without, being communicated doth induce this diſeaſe; or which is in the body, which raiſeth divers diſeaſes and ſymptomes, and can infect others, we grant that cauſe may be called a body. But we muſt take notice, that thoſe humors or vapors are not ſaid to be cauſes, as they are bodies, but as they have an occult and malignant quality, which *Minadous* himſelf cannot deny, while *Cap.* 20. he writes, That that vapor or ſpirit, which he cals the veneral virulency, is endewed with an occult quality and vertue, depending on its whole ſubſtance, by which it is able not only to infect any humors of the body, but al its parts, and to corrupt and convert them to its own ſimilitude. For what ſimilitude is that I pray, to which the Veneral virulency converts not only the humors, but alſo the parts of the body, unleſs it be that occult quality with which that vapor is endewed?

Whereas laſt of al, *Cap.* 38. he refers the Veneral virulency to external error, becauſe it primarily hurts the operation, and is not of the conſtitution of the body. But before denied it to be either the diſeaſe, or cauſe of the diſeaſe, or ſymptome, in vain doth he multiply things, preternatural; for there are not more preternatural things, than the diſeaſe, cauſe, and ſymptome; and the Veneral virulency, as he deſcribes it, doth wholy belong to the cauſes two manner of waies, for either it induceth the like diſpoſition into the parts of the body, or it raiſeth other diſeaſes while it eats and exulcerates the parts. But whenas he ſaith the Veneral diſeaſe taken for the cauſe, is a vapor or a ſpirit, that is rightly to be underſtood; for indeed it can no way be denied, that it is a humor alſo, whenas in copulation 'tis rubbed againſt the body, and ſticks in the cloaths: yet ſuch is its nature, as 'tis alſo of other contagious humors, that though it be reſolved into vapors and the leaſt bodies, yet every one of them contains its whole eſſence, and hath power to affect others: and this thing may be declared by muſk, caſtor, and the like. For thoſe things, though they be bodies, and humorous too, yet are ſuch, that though they be reſolved into the leaſt bodies, nevertheleſs they retain their ful ſtrength. After the ſame manner it is in the Veneral diſeaſe, and other contagious diſeaſes, in which though the malignant and contagious humor, be reſolved into the leaſt bodies, yet every one of them obtaines the ſame eſſence, and vertue, and power to infect others.

Whether it be a Vapor or a ſpirit.

But whereas he thinks that humor and vapor is not to be called the cauſe, but an external error, in that alſo he is miſtaken: for an external error belongs unto the cauſes, from whence the Symptomes ariſing from an external error, are called the ſymptomes of the cauſe; where this alſo is to be obſerved, that Phyſitians do not vouchſafe the name of the cauſe to the next cauſe only, but alſo to the antecedent, which do not yet effect the diſeaſe: therefore there is bad nouriſhment by reaſon of vitious humors, although they have not yet imprinted a diſtemper, and vitious diſpoſition on the parts: but whereas he denies the Veneral virulency, conſidered as a vapor to be the cauſe, becauſe it hurts the actions not by the mediation of a diſeaſe, but next of al, and imediately, he preſuppoſeth that which is not yet granted, and ſo begs the queſtion: for this ſpirit or vapor hurts the very conſtitution of the ſimilar part, and imprinteth on it a malignant quality; the which he himſelf cannot deny, whiles *Cap.* 23. he holds, that by this diſeaſe of venery many actions are hurt, but not al in al people; but the hurt of the natural faculty is common to al, and that there is none, that is poſſeſt with this diſeaſe who is not troubled with ſome fault in his natural actions, and hence proceeds al that filth of excrements, and the gummoſities ariſing from thence, tumors, puſtles,

by

pains, running of the reins, ulcers, rottenneſs, and ſuch like evils; and that the Veneral virulency hath a peculiar enmity, and diſcord with the natural faculty, and is inimicous to it by its whol kind, that is, by its form, by its ſpecifick faculty, by its whole ſubſtance, and occult propriety: but he further deſcribes the enmity againſt the natural faculty, that it is by its nature deſtructive to the natural ſpirit, that the Veneral virulency hath unſpeakable qualities, hindering the generation of the natural ſpirits, and thoſe not manifeſt, but occult. But whenas there is required to a natural action, the ſoul, the temperament, and the innate heat, or the implanted ſpirit, and the influent heat, he further concludes rightly, that the ſoul is not hurt, as that which can no waies ſuffer, nor the manifeſt temperament, as was proved hitherto, but chiefly the implanted ſpirit or the innate heat: al which whenas they are ſo rightly ſpoke, and the Veneral viruleney is an enemy to the implanted ſpirit, and truely not by manifeſt qualities, but by its form, by its ſpecifick faculty, by an occult propriety, by which it indeavours to change not only the humors, but alſo the living parts, and the implanted heat in them into its own ſimilitude, certainly the like malignant quality, is induced into the parts: which vitious & malignant quality, what other thing I pray is it, than an occult & malignant diſeaſe?

The Veneral evil is an occult & venenate Diſeaſe.

Al which being thus, we rightly conclude, the Veneral evil is an occult and venenate diſeaſe; for it is induced by cauſes of that kind, and immediately exerciſeth ſuch effects which cannot be referred to any manifeſt diſtemper, but onely to an occult quality; neither is it cured by medicines that work by manifeſt qualities, & correct known diſtempers, but by proper and ſpecificks, which al Phyſitians at this day, and eſpecially thoſe who lived at the beginning of this diſeaſe have teſtified, and to their own and patients damage have found it true. For when they followed the common way of cure, and could do no good for the cure of this diſeaſe, they began to be deſpiſed by many, til the Spaniſh Phyſitians ſhewed them medicaments brought out of the *Indies*, and bold Chyrurgeons ventered upon Quick-Silver.

What is the ſubject of the Veneral Diſeaſe.

But that al this may be made clearer, we muſt enquire what is the ſubject to this diſeaſe, concerning which phyſitians do differ. Some have thought the privities are firſt infected: for by theſe parts for the moſt part, this evil is contracted by impure copulation, and the footſteps of this diſeaſe, unleſs it be perfectly cured, do chiefly appear about the privities; the nut is eaſily excoriated in venery, the fleſh oftentimes remaines callous for a long time, with a running of the reines, and breaking forth of buboes in the groin. But though it cannot be denied, that oftentimes the original of this evil is from the privities, and doth chiefly diſcover it ſelf in that place. Yet that doth not happen alwaies, but the ſame diſeaſe may be contracted by kiſſing, ſweat, embraces, veſtures, nay infants alſo may be infected by the milk they ſuck from their nurſe, & they that are infected after this manner, have not this diſeaſe appearing in their privities.

Not the Privetie.

Some, as *Leonicenus* do hold, ſay that the skin is the ſubject of this evil, as in the ſcab, tetter, and the like affects: but the skin alone is not alwaies affected, but other parts alſo, the privities, the jawes, the bones which become rotten, nay ſometimes alſo the internal parts. *Hercules Saxonia de lue Vener. Cap.* 3. maintains a threefold ſubject; one in the beginning; another in the middle; another in the diſeaſe confirmed: in the beginning he holds that the natural ſpirit is affected or the vaporous part of the maſs of blood, then the juyces and excrementitious humors, at laſt the alimentary humors, but in proceſs of the diſeaſe, aduſt humors; and the parts affected are the ſtomach & liver, & thence chylification & ſanguification are hurt; but when the evil is old, flegmatick humors are the ſubject of it, & the parts affected are ſimelar, bones, nerves, membranous bodies: but we willingly grant, that as the diſeaſe is new, or old, ſo and alſo ſometimes more, ſometimes fewer parts are poſſeſt and corrupted; as we deny not this neither, that the excrementitious humors are eaſier corrupted than the alimentary, whenas nature doth alwaies more defend the profitable humors, than the excrementitious, into which without any difference this evil doth eaſily almoſt diffuſe it ſelf, but indeed the queſtion is not here, what may be infected by that virulency; but this is the Querie, what is the ſubject of this diſeaſe, which we have

Not the skin.

demonſtrated to be; for as in putrid feavers the ſpirits and humors wax hot, yet are not the ſubject of the feaver; ſo alſo though a malignant quality from the Veneral virulency be imprinted on the humors; yet they are not the ſubject of the diſeaſe, but only the living parts, and which of them is the ſubject of this diſeaſe is the queſtion: and whiles that he ſomtimes holds the Liver and ſtomach, ſometimes the ſimilar parts to be the ſubject of this diſeaſe, in that he is wavering, for whether the diſeaſe be new or old, the ſubject is the ſame.

Not the ſpermatical parts.

There were ſome others alſo, who held thoſe parts we cal ſpermatical, the nervous and membranous, were the ſubject of this diſeaſe; but not only the membranous and nervous parts, but alſo the fleſhy parts are affected in this diſeaſe.

Whether the liver.

Others hold the Liver to be the chiefe ſubject of this diſeaſe, and this opinion is moſt conſonant to truth, but when as many other parts are affected, 'tis conveniently to be explained, as ſhal be ſaid by and by.

Whether al the parts.

Aurelius Minadous de virul. Vener. Cap. 34. firſt of al preſuppoſeth this, that there is no peculiar member in our body, which is alwaies affected in the Veneral virulency, which is true in its way, whiles ſomtimes this, ſomtimes that part is affected; next of al he holds that this viulency is chiefly an adverſary to the natural actions, or rather to their faculties, which natural power when as it is in al parts the veneral virulency is not an enemy to one part in ſpeice, but to al, in which that power is. In the third place he adds this, That that natural vertue implanted in the natural parts, doth performe its operations without any influx, and that there is no natural faculty influent, as there is an animal influent; ſecondly he confutes them in particular, who hold the Liver to be the firſt and perpetual ſubject of this diſeaſe, for it may come to paſs ſaith he that one after an impure copulation may preſently ſuffer an exulceration in his privities, whom certainly no body wil deny to be infected with the Veneral diſeaſe, whenas yet in him the Liver is not affected: and the ſame reaſon is for other parts, which are firſt affected by contagion; nay he holds, that one external part being infected, the humors in the body may be infected without any hurt of the Liver. In the interim he cannot deny this, that this evil doth moſt properly and chiefly appear, when the Liver is affected, when as the operations of the Liver are neceſſary to the whol body. The ſame Author *Cap.* 4. endeavors to prove, that the Liver is not the ſubject of the Veneral diſeaſe, whenas the face ſaith he is the index and trueſt glaſs of the internal affects of the body, yet eſpecially the affects of the Liver doe appear in it; therefore if the Liver were perpetually affected in the Veneral diſeaſe, alſo the color of the face ſhould alwaies appeare vitious, the which we have found falſe by experience; for we have ſeen both men and women infected with this diſeaſe, who notwithſtanding have had a freſh color in their face, and the evil hath been in their privities: again he thinks, that by carnal copulation the privites may firſt of al be affected, and from thence the evil may creep through the veins, and by the ſpirits, to the other parts of the body, and as one part is more apt and diſpoſed than another to receive the infection, ſo ſomtimes this, ſomtimes that is infected, but not alwaies the Liver.

The Authors opinion.

That we may cleare our ſelves of this controverſy, firſt of al we muſt enquire from the actions hurt what part is affected, and what faculty is oppreſt; but though divers actions hurt that part in the veneral diſeaſe, yet al of them cannot bring us to the knowledg of the firſt and proper ſubject. It happens indeed ſomtimes, that there are pains felt in the head about the muſcles and bones, but that is not alwaies. Somtimes alſo the hurt happens in the external and internal ſences, but this alſo is ſeldom: ſomtimes putrid vapors are inflamed, and hence a Feaver is raiſed, which ſome cal a French Feaver, but this alſo happens ſeldom. In like manner 'tis in other diſeaſes and ſymptomes. One action is hurt which is common to al that are ſick of the veneral diſeaſe, viz. nutrition is corrupted; hence we ſee that in thoſe who are poſſeſt with this diſeaſe, the color of their body is changed and ſulled, and ſometimes turns black, ſomtimes of a lead color, ſomtimes livid. There ariſe every where in their body divers kinds of ſwellings and bunchings out, alſo ulcers, the bones rotten, the hairs fal off, al which proceed from corrupt nutrition. From which we conclude that

the

the veneral disease is primarily an enemy to the natural faculty: but 'tis no wonder that this poyson is only an enemy to the natural faculty, whenas there are other poysons, which are inimicous to other faculties: thus the poyson of the pestilence and many others are enemies to the heart, cantharides to the bladder, mad night-shade and opium to the animal faculty. *The Veneral disease is an enemy to the natural faculty.*

Whence that we may briefly conclude the business, this evil indeed may be contracted by one member, yet if it be spread into more from that one, that comes to pass because the Liver is infected: yet because this poyson hath principally an enmity with the natural faculty, and the fountaine of that, or chiefe seat is the Liver, that also is primarily infected with this virulency, and through that the rest of the parts contract this evil. Therefore whereas *Minadous* objecteth, the color of the face is sometimes fresh, therefore the evil is not yet communicated to the Liver, but stil sticks in the privities which were first of al infected, and the force of this virulence is sometimes greater, sometimes less; from whence also 'tis sometimes sooner, sometimes later communicated to the Liver. Besides, this evil consists not in the first qualities, but in occult, whence 'tis no wonder, that that malignity may consist in the blood, which to the appearance is good; but al those things wil be yet made clearer by the discovery of the causes.

Chap. IV.

Of the Causes.

BUt concerning the causes of this disease, two things are to be explained, the first is how at this day the Veneral disease is contracted; the other is, what was its original when it first appeared. At this day indeed I think this evil is no otherwise contracted, than by contagion, and that 'tis manifest that every Veneral pox is not contagious *Hercules Saxonia, lib. de lue Vener. cap.* 3. Holds that every Veneral pox is not contagious, and that which is old and confirmed is for the most part less contagious, than that which is new, and of a middle age, and that which discovers it self by knobs, is not contagious; and he endeavors to prove it, first of al by reason; because the contagion is placed in a hot and movable excrement, but when nothing breaths forth from the part affected, which can be communicated to another, the disease then is not contagious, and therefore because in the knobs there is no such excrement contained, or if it be contained, it is not carried to the genitals, therefore that disease shal not be contagious; next of al by experience, for he writes that a certain noble man of *Padua*, who had used Guajacum almost twenty times, and was thrice anointed with quicksilver, yet could never be cured, and though he lay with Virgins yet he never infected them: and out of *Antonius Musa* he relates of one, who had a wife possest with the Veneral disease about her breast, yet he never contracted the disease. *The Veneral disease is contracted only by contagion. Whether it be alwaies contagious?*

But here we cannot assent to *Saxiona*, but we hold that every Veneral disease is in its manner contagious; but whereas he objects against us experience, it doth not follow, that if one sick of the Veneral disease doth not actually infect another, that the disease it self is not contagious; for that an effect may follow, there is necessary both an agent, and a disposition required in the patient. Hence we see that many do converse with those sick of the Plague, and are not infected, yet we must not conclude from thence, that that Plague was not contagious: & *Gabriel Fallopius de morb. Galli. Cap.* 22. makes mention of twelve Schollars, that had to do with one whore, yet of al them, three only were infected. And *Saxonia* himself affords an answer to this argument, while he writes, That this disease is not contagious if nothing breath forth from the part affected, which may be communicated to another, the which may happen in the knobs and callosities; or if any thing do breath forth, and be not received by another. Therefore though

one have an ulcer in his head, or a knob in his thigh, but the Genital parts be found, 'tis not necessary he infect her he lyes with. But whereas he teacheth that the inveterate Veneral disease is less contagious, than the new, or middle aged it may in its manner be granted; and from that very thing we may collect, that the Veneral disease is not only the cause, but also the disease. For when as this disease is communicated by the cause or contagion, it may come to pass, that the cause may be for the most part taken away, which doubtless happned in him who so often used the decoction of Guajacum, and was thrice anointed; and such men indeed, if the disease be still upon them, but the corrupt humors being for the most part emptied by sweaters and unctions, they are not so contagious, as those, who were lately infected with this out of whom those malignant humors have not yet been emptied.

Therefore we conclude, though for certaine reasons, those who are sick of this disease do not alwaies infect others; yet at this day there is no man taken with this evil, but who hath been infected by contagion from another, and so this evil at this day is propagated only by contagion.

The first original of the veneral Disease.

But how, and from what causes this Disease was raised, when it first appeared in Europe, Authors are diverse in their opinions; and whenas they themselves, who lived about the rise of this disease, could not agree in this business, by much less shal we which are now removed above an age from that time, be able to reconcile them; therefore we shal only reckon up their opinions. The most learned *Leonicenus*, and *Fracastorius*, and certain others, were of this opinion. That this disease at its first rise was epidemical, and proceeded from a common cause, when at its first beginning, boyes, men, old folks, Girles, women, were infected, and as *Hieron. Fracastrius* writes *de morb. Gallic. cap.* 7. Though the greatest part of mankind hath contracted this disease by contagion, it hath been observed, that a number of others infected by themselves without any contagion, have suffred this disease. Besides *Fracastorius* thinks it impossible, that in so smal a time, contagion which of it self is slow, nor is not easily received, could spread it self over so many lands, being first brought by one fleet of the Spaniards, when it is plain that either at the same time, or very neere it was seen in *Spain* and *France*, in *Italy* and *Germany*, and almost al *Scythia*; which if it be so, there is no reason, why we should not grant this disease to have been first of al epidemical: yet this makes me doubtful because that no German Physitian, nor of the neighboring places, hath taken notice, that this disease was knowen in Germany about that time. In which it appeared in *Italy*, when notwithstanding they have most diligently described, the English sweating disease, the disease in *Hungary*, and the like diseases newly sprung up.

Whether it were first of al an epidemical disease.

But what was the cause of that epidemious disease, if it were such a one, those Authors themselves do differ in opinion; indeed they agree in this. That it had its original from the fault of the ayre, but whence the ayre contracted that fault, therein they differ. Some were of opinion, That this disease had its original, from the great inundation of *Tiber*, and other Rivers, which hapned in the time of *Adrian* the sixt, Pope of *Rome*: for the Summer following they think by that corruption and filth left by the waters, the ayre was infected with putrefaction, and thence this disease did proceed. But truly this evil cannot be imputed to that inundation of waters, since that happned chiefly at *Rome*, but this disease first appeared at *Naples*: besides, those inundations of waters are wont rather to cause pestilent diseases, and there has often happned such inundations before, yet such a disease was never caus'd by them before. Others do more probably (if this disease were at first epidemious) refer the cause to the Stars. And *Fracastorius* writes concerning this business, *lib.* 2. *de morb. contag. cap.* 12. That it ought not to seem wonderful, that new and unusual diseases do appeare at certain times, and he proves it by examples and histories of divers diseases; and to pass by others, in the memory of our Grandfather that malignant Feaver raged, which is commonly known by the name of the English sweat, the like of which we have not read in any History before, wherefore he thinks it is not strange, if also the French disease not known before through many ages in our Orb, did now first of al break forth. And there wil come (saith he) other

new

new and unuſual ſickneſſes, when time ſhal bring them; as there was the thing out amongſt the Ancients, which afterwards was ſeen no more. This ſame diſeaſe wil dye and be extinguiſht, and by and by again wil be renewed, and ſeen again by our Nephews, even as in former Ages, it is to be beleeved, it was ſeen by our Anceſtors, for which there are no ſmal ſigns yet evident. A certain Barber a friend of mine, had a book of certain experiments, very ancient, amongſt which was written one amongſt the reſt, whoſe title was, For the thick ſcabb, which happens with the paines of the joints; he therefore when he diſeaſe was very freſh at firſt, remembring this medicine, asked counſel of ſome Phyſitians; whether he might uſe that medicine in that new contagion, which he thought was ſignified by that thick ſcabb: but the Phyſitians viewing the medicine, ſharply forbad him, becauſe it conſiſted of quickſilver and ſulphur. Happy man if he had not conſulted with thoſe phyſitians, being like to be very rich with an incredible gaine; but he obeyed them, nor durſt not make tryal of his medicine, which at laſt he did try, and finding it to be excellent good, he was very ſorry, that he had uſed it too late, the profit being now carried away by others. Thus far *Fracaſtorius*.

But he refers the cauſe of this diſeaſe newly ſprung up, to the conjunction of *Saturn*, *Mars*, and *Jupiter*, which happned at that time. Others hold that in the yeare, 1483. In the Ides of October at two of the clock after noon, That there was a conjunction made of *Mars*, *Jupiter*, the *Sun*, and *Mercury* in *Libra*, in the eight houſe, which is the houſe of Sickneſs, and that *Jupiter* was burnt; and furthermore the ſame yeare on the Calends of November in the ſame houſe and ſigne, there was a conjunction made of *Mars* and *Venus*, alſo of *Jupiter* and *Venus*. Others as *Nicolaus Maſſa de morb. Galic. cap.* 6 refer that diſeaſe to the conjunction of *Saturn*, *Mars*, and *Venus*, which happened in *Scorpio* about the riſe of this diſeaſe. But as it is not impoſſible, for certain configurations of the Stars to induce certain diſeaſes, ſo no man is able eaſily to render the ſpecifick cauſe of this diſeaſe, if it were epidemious. Truly al the effects of the Stars are good and benigne, and nothing evil in it ſelf doth proceed from them; yet by accident it may come to paſs, whiles they alter the ayre & the bodies of men after this or that manner, that they may produce evil diſeaſes, whenas in their way they are Authors of the generation and corruption of natural things, but that they could produce this diſeaſe in ſpecie, I think is not yet explained; and *Fracaſtorius* had hopes indeed, that this diſeaſe was in its old age in his time, and that in a little while after it would ceaſe in the alleaged place; as alſo in his *Syphilis*, in theſe Verſes.

For when the Fates ſhal pleaſe again, you'l ſee
Ere long, that in dark night 'twil buried be.

But his hopes hath deceived him, whenas now it hath laſted above a hundred and forty yeares, and hath bated nothing of its cruelty, as moſt are of opinion.

Others on the contrary think this diſeaſe was not epidemious, but ſporadical and contagious; and firſt of al this perſwades many, becauſe it hath laſted even unto theſe times, whenas epidemious diſeaſes, which have been raiſed by the influx of the Stars, have ceaſed a little while after. And therefore they do not think this diſeaſe ought to be accounted for epidemical, whenas it hath already laſted above 140. years; unleſs perhaps this reaſon may be given for the continuance of this diſeaſe, becauſe the infection of this diſeaſe is not ſhunned, as that of the peſtilence. For if the Plague begin to ſpread any where, al people, as much as they are able, and 'tis poſſible for them, do fly from the converſation of the ſick, and reject al infected houſehold ſtuff; nay in *Italy*, if the Plague begin to ſpread in *Germany*, or other neighbouring Countries, they ſtop up al publique waies, and deny al ſtrangers that are ſuſpected, any admittance into *Italy*; But many men knowingly and willingly have to do with ſuſpected Harlots, and publique Stews ful of infected whores are tolerated; therefore if the ſame diligence and curioſity, which is uſed in ſome places in the time of the peſtilence to exclude the infected and ſuſpected perſons, from the ſociety of others, were made uſe of to reſtrain that rambling whoring

perhaps

perhaps this disease also though it be contagious, might be rooted out.

How the Veneral disease was brought into Europe.

Yet the same men who think this disease is not epidemous, but sporadical, and contagious, are againe divided into divers opinions concerning its original: For some were of that opinion, that first of all it had its rise at *Valentia*, in *Hispania Tarraconensi*, where one sick of an Elephantiasis, bought a night's lodging of a noble Whore for fifty peices of Gold, and infected her, and thence it came to pass, that others who had to do with her were infected, and so in a short time this evil was disseminated amongst a many. But the Idea of an Elephantiasis is one, and of the Veneral disease another, and therefore one sick of an Elephantiasis could not raise this disease.

Others think this disease was first brought out of *India* by the Spaniards into the French Army at *Naples*, who maintaine that this disease was epidemical in *India*, of which we spake before, *Cap.* 1. But for what reason 'tis epidemous in some Countries in *India*, whether by the fault of the aire, or water, or provision, is not yet explained by Historians.

Leonhardus Fioravanti his opinion of the Veneral disease.

Leonhardus Fioravanti, a famous Empirick in his time in *Italy*, hath a peculiar opinion of the original of this disease, which I have met withal in no other writer. For he in his book written in the Italian Tongue, which is entituled, *Capricci Medicinali di M. Leonardo Fioravanti, Libri tre*, writes thus of the original of this disease, both amongst the Indians, and in the French Army at *Naples*, *lib.* 1 *Cap.* 26. When saith he, there was War between the French and Spaniard at *Naples*, and there was great want of provision, especially of flesh, those evil imployed merchants who brought victuals to the Camp, had privately prepared the Carkasses of dead souldiers into divers kinds of meates and dishes, and sold them every where about to the army, which flesh, whanas they had eat of it a long time ignorantly, most of them were taken with this disease, and became ful of pustles and paines, and many also had their hair fal off; and he writes, that he knowes the business was so, from one *Paschalis Gibilottus*, a Neapolitan, an old man, of ninety eight yeares of age, who hath told him, that at that time when *John* the Son of *Renatus*, Duke *Andegavensis* waged war against *Alphonsus* King of *Naples*, about the yeare 1456. that he hath often heard from his father, who was such a Merchant in the Army of King *Alphonsus*, that in want and scarcity of victuals the Souldiers on both sides by eating of mans flesh, which they fed on for a long time, contracted this disease, and the same *Fioravanti*, adds, that he might be the more certain of this business, he bred up a Sow in his house, and added to al her meat somewhat of hogs flesh, and that within few dayes her bristles and hairs fel off, and she became ful of pustles; then, that he fed a dog for two months only with dogs flesh, which afterwards became ful of pains and pustles, and lost his hair. From which experiments he concludes; that every living creature if it be nourisht with the flesh of its own species will be taken with this disease, which at this day is called the French: and he thinks this is the very cause, that this disease is epidemious in the *Indies*, because there are those man-eaters, which do feed on mans flesh.

But truly I do wonder that so many Italians and French, who have writ of this disease have made no mention of this cause, neither does the relation of that old *Neapolitan* seem to fit with the time. For that disease was not known in the year 1456. at which time *John* the Son of *Renatus*, Duke *Andegavensis*, waged War against *Alphonsus* King of *Naples*, but in the War which *Charles* the eight King of *France*, waged with *Alphonsus* King of *Naples* about the yeare 1493 or 94. then grant it be, that if a creature nourisht with the flesh of those of its own kind, be taken with pustles and pains, and suffer the falling off of the hair, yet the question stil would be, whether that disease be the very Veneral disease, and such as may be transfered by contagion to others, and especially by Venery. For the essence of the veneral disease doth not consist in pustles, and the faillings of the hair, but in an occult malignity, by which also its ulcers do differ from other ulcers. Yet it is easy for any one to make tryal, of that which *Fioravanti* experienced. And if the

business

buſineſs ſhould be confirmed by experience, that if an animal nouriſht with the fleſh of its kind, do contract this diſeaſe, thence a reaſon may be rendered, why this diſeaſe is endemious to the people of *India*, to wit, becauſe its inhabitants do feed on mens fleſh: although here we meet with a doubt, for al the people of *India* are not men-eaters, and therefore we muſt enquire out of the Hiſtories of the *Indies*, whether this diſeaſe be endemious amongſt the men-eaters only, or amongſt the other people of the *Indies* alſo.

Andreas Cæſalpinus

Andreas Cæſalpinus, lib. 4. de morb. Cap. 3. writes that he hath another Hiſtory of the original of this diſeaſe, delivered by them who were preſent, to wit, from an Aretine ſoldier, who ſerved in that war; he related that there is a town in the *Veſuvian* Mount which is called *Suma*, where there is plenty of generous wine which is called Caudy wine, which was privately left by the Spaniards in the night, when the French had beſieged it, but they infected their wine by the mixture of blood which they drew from them which were ſick in the hoſpital of St. *Lazarus*; and the French men entering in, when they had filled themſelves with that wine, began to be ſick of diſeaſes and ſymptomes, like unto the Elephantiaſis. But if this were true, rather the Elephantiaſis than the veneral diſeaſe had been thus raiſed.

Aurelius Minadous

Aurelius Minadous de Virul. Vener. Cap. 30. propounds a peculiar opinion, & holds that this virulency did firſt break forth from the moſt filthy wombs, of moſt impure Harlots, and for this cauſe, becauſe no body that hath lived cleanly, or that hath converſed with a cleane woman, is taken with this evil: but he thinks this evil proceeded firſt, when women were made very unclean, when they had received a various mixture of ſeeds. For as ſaith he one ſort of meat, is the cauſe of health in a good ſtomach, but variety of meats doth oppreſs the ſtomach, and breeds an acid and nidorous crudity, and every where heaps up excrements; ſo one ſeed only is familier and wholſome for one womb, and cauſeth fruitfulneſs, on the contrary the multitude and variety of ſeeds, doth ſo affect the womb, that by its corruption it produceth bad, nay the worſt of excrements, and from that ſordid ſubſtance there is a corruprion hard to be explained, or putrefaction which doth generate ſuch venenate excrements. But when as he might eaſily underſtand, that thoſe rambling luſts were in uſe not only in the war at *Naples*, but long before when there was publique Brothel Houſes at *Rome*, and yet there was no ſuch diſeaſe raiſed; he would have his opinion to be underſtood not of any women, but only of the *Indian*. For they by the mediation of the Heaven, Air, Waters, and thoſe places, by their peculiar form of feeding did contract this poyſon, which afterwards by *Columbus*, and the Spaniſh Army was diſſeminated in *France*, and hence through the whole world. But though it muſt not be denied, that the conſtitution of bodies is divers in divers Countries, and I remember that I have read in the Hiſtories of Navigation, That when certain people of *Europe*, had found certain Ethiopian laſſes playing on the ſea ſhore, and had layn with them, preſantly ſome of them died; yet how the buſineſs is in *America*, is worthy of further inquiſition: and if there be any ſuch fault in thoſe women, 'tis probable that comes to paſs, not ſo much from the commiſtion of divers ſeeds, but rather as many Authors report, from this, That if any one have to do with a woman in *India* whiles ſhe hath her courſes, he his taken with that diſeaſe; for that whenas 'tis every where unwholſome, and therefore alſo was peculiarly and ſeverely forbidden the Jewes by God in holy Writ, may in a ſpecial manner be hurtful in the Indies.

The Veneral diſeaſe is contracted only by contagion.

Therefore letting theſe paſs, let us hold faſt this, which is granted by al, that this diſeaſe at this day is no otherwiſe contracted, but by contagion, and chiefly by lying with thoſe that are infected, whence deſervedly doth *Gabriel Fallopius de morb. Gallic. Cap. 13.* Wittily deride thoſe women, who when they were ſick of the Veneral diſeaſe, nevertheleſs did boſt themſelves to be chaſt, and ſaid they contracted this diſeaſe by ſprinkling themſelves with the holy water which was infected.

How many waies the contagion may be contracted.

But this contagion, by which only now adayes, we ſay this diſeaſe is diſſeminated, is received divers waies. For ſometimes 'tis transferred with the ſeed and menſtruous

Somtimes 'tis Hæreditary.

ſtruous blood from the Parents to the Child, and the Diſeaſe becomes Hæreditary; for when the blood, out of which the Seed is generated, is infected and vitious, the like Diſeaſed ſeed is generated, alſo the Mothers blood being impure, with which the Child is nouriſht, it Pollutes that, which pollution afterwards in thoſe brought into the World doth ſooner or later ſhew it ſelf, according to the greater or leſſer ſtrength of that virulency: which manner of original of this Diſeaſe, if any one wil deny to be properly by contagion, becauſe it is not by the contract of two bodies, viz. a ſound and a ſick, he may for al me; yet let him know this, that then that malignity in the body of the infant is not generated, but from the infected parents by the ſeed, or the Mothers blood is communicated to the off-ſpring.

But by thoſe that are born into the world, the ſame evil may be contracted two waies: the firſt is, when with the nouriſhment and milk, the evil is communicated to infants by impure Nurſes; which way indeed is the powerfulleſt of al: for whenas the milk they ſuck is changed into blood, and that is the nouriſhment of the whol body, the poyſon this way is diſperſed into the whol body, and inſinuates it ſelf moſt intimately with it, and therefore thoſe that are this way infected, are ſeldome cured, and not without a great deal of Difficulty.

The other way is by contagion ſo called properly, and in ſpecy; where firſt of al 'tis enquired, whether there be any contagion in the Veneral Diſeaſe at a diſtance, ſo that if one do neither touch with his body one infected, nor the fuel which conteins in it the contagion, yet nevertheleſs may be infected with the Veneral Diſeaſe; truly there is no example given of this cauſe, but what *Manardus* teacheth, Lib. 7. Epiſ. 3. and alſo ſome others affirme that there is a French Ophthalmy: but when as this Diſeaſe of the Eyes in other caſes is oftentimes contagious, it is no wonder, if one converſing with a ſick man that is troubled with a French Ophthalmy, and earneſtly look upon his Eyes, that he alſo may contract ſuch an Ophthalmy. Yet this cannot be granted, that as the Plague may be transferred by the Air to others in diſtant places, ſo alſo the Veneral Diſeaſe may be communicated; for dayly experience doth Teſtefie, that Phyſitians and many others, do familiarly converſe with thoſe infected with this evil, yet are not infected by them.

Whether it can infect at a diſtance.

Therefore this evil is chiefly contracted by contact, and truely moſt frequently by whoriſh Copulation, when that virulence is communicated to the naked genital parts being ſoft, and porous, from the genitals of the other infected perſon; after which manner this Diſeaſe was firſt brought out of the *Indies*, by the Spaniſh Souldiers infected by the *Indian* Women which were ſick of this Diſeaſe, into *Italy*, and diſſeminated through the French Camp, and hence ſpred throughout all Europe, as we ſaid before according to the opinion of many Phyſitians. And though ſome as we ſaid even now, who have been infected with this Diſeaſe, endeavour to renounce the Cauſe of it; yet many if they live not chaſtly, yet they live cloſely, and *Gabriel Fallopius*, not without a Cauſe *de Morb. Gall. cap.* 10. ſcoffs at certain chaſt Matrons, as they boaſted themſelves to be, who ſaid they contracted this Diſeaſe by ſprinkling them with holy water which was polluted; he that beleeves this, let him beleeve that too, which *Averroes* writes, 2. *collect. cap.* 10. that a woman was got with Child in a bath, from ſome ſeed which wicked men had ſpent there: or with *Valleſius* let him correct the Aphoriſme, 36. *Sect.* 6. becauſe many Monks have been ſick of the Gout before the uſe of Venery.

How the Veneral diſeaſe may be contracted.

How men are infected by women in Copulation.

And truly men contract this evil from Women that are infected, becauſe in the act by reaſon of the concourſe of ſpirits, and the motion, the Womb being heated, Vapors are raiſed from the Malignant Humors in the womb, which are ſuckt in by the mans yard being of a porous conſtitution, and are received into the veins. But the man being infected, may infect a ſound woman, either by his yard, if that be infected and exulcerated, or by his ſeed, although his yard be not ulcerated, or both waies: for though the ſeed in men is not always wholly corrupt, whenas we ſee many men infected with this diſeaſe do get children; yet it is altered & infected, from whence not only

How Women by men.

the

the Issue contracts this evil, but also a Woman may be infected by it.

But though this evil be most frequently contracted by whorish Copulation, yet by contagion it may be derived to others, other manner of waies, viz. by sweat, if any one sleep in the same bed with one infected with the Veneral Disease, and be wet with his sweat; then by the filth and Excrements, or that flowing from Ulcers, and sticking on the Linnen, bed, or shirt, and garments, if any one lie in them, or put them on. The same Disease also may be communicated by slaver or spittle, so lovers are infected with the Kisses of Whores sick of this Disease, and infants by their Nurses, or if any one drink out of a Cup, or sup out of the spoon, which one sick of this Disease did use a little before; besides, infants may be infected another way, to wit if, they touch the brests of an impure Nurse with their mouth, and that for a double reason, either because they suck the infected and corrupted milk, of which I spake before; or because the breasts and nibbles of the Nurse are exulcerated: on the contrary, Nurses may be infected from infected infants, especially if they be troubled with Malignant pustles, or some Ulcer in the mouth; for the Nepples of their breasts whiles they are suckt by the Infant, grow hot, and their pores are more opened, whereupon they eatier receive in that virulence. *Other waies of contagion*

But no body is easily infected by the breath, as was said before, and without danger we may be conversant in the same chamber with those that are infected; neither are those Chyrurgions and Physitians which cure the veneral Disease, and dayly converse with the sick, any way infected; and if this Disease were contagious by breathing and at a distance, the whol world would ere now have been French, and the Disease would be more than Epidemious, as one writes; yet if any one sleep in bed with one infected, that he do receive his breath very neer, I wil not promise him free from this evil; whenas I know, Wives that have been infected by their Husbands sick of the Phthisick, and afterwards died of it.

This contagion after 'tis received into the body, staies not in those parts in which it was first received, but after the manner of other poysons, penetrates into the innermost parts of the body: and truely oftentimes discovers it self presently, within a few daies, somtimes lies hid a long while. And *Fernelius* writes, *de abdit. rer. Caus. Lib. 2. c. 14.* That it doth somtimes returne and revive after thirty years past, and for so long space the fewel of the disease does lie hid as dormant, and nevertheless they who think themselves free from al hurt, and that they are perfectly sound, do corrupt those with whom they lie, and beget an Issue possest with that Disease. The same is witnessed by *John Philippus Ingrassias.* And *Hercules Saxonia de lue Vener. cap.* 11. relates that he cured an Illustrissimo, who had knobs of the French Disease came out upon him, five and twenty years after he had taken the Disease. *How the Veneral virulency doth penetrate into the body.*

But what parts this virulency doth principally assault, we said formerly Authors did disagree, where we treated of its subject; many indeed do hold, that this virulency is chiefly an adversary to the Membranes, because the pains do most of al arise about the Perioštia, and external parts, where are many Membranes, in the head, Legs, Arms, breast-bone, and in them the periostium being eaten off, are raised knobs. But not only the Membranous parts are affected, but others also, as the Buboes, Tumors, Ulcers in divers parts, rottenness of the bones, falling of the hair, running of the Reins do testefie. And therefore we must enquire for a more common subject, which we said above was the Liver, and the similar parts dedicated to nutrition, and that have consent with the liver; for after the contagion hath pierced as far as the Liver (though in the interim it may corrupt the parts neer unto that, by which the Contagion was received) and hath imprinted a Malignant disposition on that, Sanguification is hurt, and a Malignant quality is imprinted on that blood, which is generated in the Liver, and so with the blood are generated Malignant Humors, which whenas they are troublesome to Nature, they are thrust forth to the Circumference of the body, and so *What parts are chiefly affected.*

not only pains are raiſed in the Membranes, but divers Diſeaſes and Symptomes alſo in other parts; and whereas the bones are not free, but they are oftentimes affected with rottenneſs, it is no wonder that the neighbouring perioſtia are affected, and moſt cruel pains raiſed.

The manner of the generation of the veneral diſeaſe. From al which it doth eaſily appear, what is the manner of the generation of this Diſeaſe, to wit, When the contagion of this Diſeaſe is communicated from one ſick of the Veneral Diſeaſe, either by the ſeed and blood of the parents, or by the ſucking of infected milk, or by Copulation, or by ſpittle, or by meat and drink, or by garments and Linnen, to any part of a ſound body, firſt of al the part which receives the contagion is affected and hurt, hence through that, the evil creeps into the Veins, and by them penetrates to the Liver, which when it hath put on an evil diſpoſition, and contracted a Malignant Diſeaſe, it generates vitious blood, containing in it the Seeds of the veneral Diſeaſe, which whenas it is an enemy to the body, by the expulſive faculty 'tis driven from the more noble parts to the Circumference of the body. And from thence the nouriſhment in the whol body is hurt, from whence are raiſed ſpots, Tumors, and divers bunchings out, Ulcers, falling of the hair, pains, and other evils.

The definition of the veneral diſeaſe. At length out of al thoſe things which have been ſaid hitherto of the Nature and cauſes of the veneral diſeaſe, we make this definition of this Diſeaſe. The veneral evil is an occult Diſeaſe, and peculiarly Malignant, taken by infection, and is infectious, chiefly an enemy to the Liver and nutritive faculty, and therefore nutrition being hurt in the whol body, it raiſeth divers Diſeaſes and Symptomes.

CHAP. V.

Of the Differences of it.

The Differences. BY ſome indeed there are reckoned up very many Differences of this Diſeaſe, and by *Braſſavola*, 234. but many of them unprofitable; the moſt neceſſary and profitable are theſe.

Firſt of al, as concerning the very eſſence of the Diſeaſe whenas that is unknown, from that of it ſelf, we can raiſe no difference: yet becauſe its activity depends on that eſſence and occult quality, theſe differences are fetcht from thence, becauſe the activity of this diſeaſe is ſomtimes greater, ſomtimes leſs. And Phyſitians have obſerved, that ſomtimes after unwholſome Copulation, the French Symptoms have preſently come upon men, but ſomewhat gentle, and a little while after have ceaſed again, without the adminiſtration of any remedy; but ſomtimes moſt grievous Symptoms have preſenly come on them, and the evil hath been rebellious, and could by no means or very difficultly be cured. And the writers of this diſeaſe report, That this Diſeaſe when it firſt appeared, had far more grievous Symptomes, than now it hath: but what was the Cauſe of this buſineſs, is not ſo clear. That might happen firſt of al, from the diſpoſition of the bodies that were infected. For whenas it appeared firſt in the Camps at Naples, and there was a great ſcarcity of proviſion, and a famine, doubtleſs in thoſe bodies alſo, there was proviſion of evil Humors for Diſeaſes, on which when this contagion fel, there it took ſtrength and increaſed: beſides this might make ſomwhat to that buſineſs, that in the beginning, the cure of this Diſeaſe was not ſufficiently known, whence it came to paſs, that this malignity alwaies grew worſe. This happens alſo in the Plague, of which the more there die, the poyſon alwaies grows the more vehement. For the malignity is fermented as it were, and exalted in the bodies of the ſick, unleſs it be oppoſed and overcome by Alexipharmacal means.

At its firſt riſe this diſeaſe was more grievous.

Secondly,

Secondly, its Differences are taken from the cauſes and manner of contagion while ſomtimes the Veneral Diſeaſe is hæreditary, and is derived with the ſeed and blood from the parents to the Iſſue: but ſomtimes after the birth, is communicated by Copulation, Kiſſing, Milk, Garments, and the like.

Thirdly, the third Difference is taken from the Diſeaſes and Symptoms ſupervenient, that this Diſeaſe is ſomtimes with Buboes, ſomtimes with running of the Reins, ſomtimes with falling of the hair, ſomtimes with pains of the joynts, ſomtimes with other Symptomes; neither do the Symptomes which follow it, and ſhal afterwards be reckoned up amongſt the ſigns, alwaies appear the ſame in al people: and *Euſtachius Rudius* writes, *Lib. 5. de Morb. occult. Cap. 9.* That he hath obſerved a thouſand times, that many young men have on the ſame day copulated with one and the ſame whore, and yet notwithſtanding one hath been taken with the running of the Reins, another with a Bubo, another with rottenneſs, another with pain in the Head, another with falling of the hair, and another with another different preternatural affect; which doubtleſs happens, by reaſon of the various indiſpoſition of bodies, and weakneſs of parts, and variety of Humors. For weak parts do more eaſily receive vitious Humors, than the ſtrong. And one body is more clean, another more foul, and abounds with theſe, or thoſe Humors, which when they are corrupted by the venenate Humor, do cauſe theſe or thoſe Diſeaſes and Symptomes: therefore if we ſhould number up the Differences according to the variety of Diſeaſes, and Symptomes, which are ſomtimes joyned together and complicated, ſomtimes Fewer, ſomtimes more, we might make very many indeed, of which as was ſaid even now, *Braſſavola* reckons up 234. more Nicely than profitably.

Fourthly, the fourth Difference is from the time, that this Diſeaſe is ſomtimes new, ſomtimes inveterate, one in the beginning, another in the augment, another in the ſtate, and another in the declination.

Out of which, and eſpecially from the Difference of time, and the variety of Diſeaſes, and Symptomes that accompany this Diſeaſe, *Julianus Palmarius*, doth commodiouſly conſtitute four dergees of this Diſeaſe, *de lue Vener. Lib. 1. cap. 4.* The Firſt and lighteſt degree is, when only the hairs of the Head and beard do by little and little fal off, without any other hurt of the body. The Second degree is worſe, when the whol Skin is ſpread over with many ſpots not bunching out, and thoſe ſomtimes ſmal, like to a lentil ſpeck; ſomtimes much broader, and both, ſomtimes red, ſomtimes yellow. The Third degree is yet more grievous, when not only ſpots but true puſtles and bunches break forth, firſt of al indeed about the forehead, and Temples, and behind the Ears, then every where in the Head, and at length in the reſt of the body. The Fourth degree is, when now the Diſeaſe being inveterate, it aſſaults and corrupts the ſolid parts, the bones, Ligaments, Membranes, and Nerves. In which there are collected many thick, glutinous, and maligne Excrements, which when they reſt about the tendons, or the Perioſtia, and prick and pul the Membranes from the bones, there are wont to be cauſed implacable pains, growing worſe towards the night, from which Excrements alſo by degrees do grow hard knobs, with far greater torment which are equally hard as the bones. Which if they be fixt in the bones, they do ſo enlarge and diſtend them, that the bones oftentimes become of a monſtrous bulk and figure: moreover that malignity and Acrimony doth by degrees eat away, and with rottenneſs conſume the bones, and for the moſt part not hurting the Skin that lies over them; and *Palmarius* writes there, that he hath ſeen many in whom the Pericranium, and the Skul under it, hath been found wholly eaten away with putrefaction, and conſumed with rottenneſs as far as the dura mater, the Skin of the Head not being hurt at al, without any Feaver, and without

Degrees of the veneral diſeaſe.

without vomiting, of which one or two have been seen living without a Skul. Of which by and by shal be said more in the Diagnostick and Prognostick signs.

CHAP. VI.

Of the Diagnostick Signs.

BUt though out of those things which have been spoken before of the History of this Disease, the Diagnostick signs of this Disease might easily be fetcht, yet in this place the same are to be propounded in specy. But first of al, we must remember this, those signs as *Galen* teacheth, 1. Aphor. 17. and else where, which ought certainly to denote a Disease, which are commonly called Pathognomonical, ought to be not only proper but inseparable, so that where they are, there is the Disease, and they being taken away the Disease is removed. But though as in many other diseases, so in the Veneral, there is not one sign, by which the Disease may be known, yet a concourse of signs, may do the same. Yet what that concourse is in the Veneral Disease, is not easie to define: whenas in this Disease there is a great Accumulation of Symptoms and Diseases, and therefore this Disease hath affinity with other Diseases. Which thing doth cause, as was said before, that many when they saw almost the same concourse of signs, in that Epidemious disease, which *Hippocrates* propounds, the 3. *Epid.* they thought the Veneral Disease was described there, and others referred it to the Elephantiasis, but the reason why it is hard to define the concourse of signs in this Disease, is this, because the Liver and nutritive faculty of the whol body is chiefly hurt. For when the heart or brain is hurt, their hurt actions do easily appear, being such as are simple, and restrained to few parts. But when as the Liver affords nourishment for the whol body, from thence if nourishment be hurt, do happen divers Diseases and Symptomes; for though the nutriment of the whol body be one, that is blood, yet almost an innumerable variety presents it self in every part, according to the variety of the parts which are nourisht, whenas 'tis necessary that every part do peculiarly assimilate its nourishment; yet if we consider the precedent causes, those things which are present, and what things are helpful, what hurtful, or the Remedies, neither can this Disease lie undiscovered.

The diagnostick signs of the cause.

As concerning the causes, first of al if the parents be, or have been sick of this disease, and some signs in the infant present themselves, which argue the Veneral disease, there is scarce any reason to doubt of the Disease. In like manner 'tis, if an infant have sucked a nurse sick of this disease.

But if any one born of sound Parents, and nourisht by the milk of a sound Nurse, yet have diseases and some Symptoms, which give suspition of this Disease, we must diligently enquire, whether he hath had to do with infected persons; which if he confess, the case is plain, and there need no further doubt of the species of the Disease; but if, as it often fals out, one to preserve his Honor and reputation, deny that he hath acted any such thing, then we must enquire into the condition and course of the life past, of the husband or wife, if the party be married. For from these things somtimes we have no slight conjectures of the infection. But if there be no ground for such a conjecture, we must further enquire, whether he hath slept in the same bed with one infected with that Disease, or hath used his garments. But if out of al these there can be had no firme conjecture of this Disease, the present state of the patient is diligently to be considered, which indeed is one in the beginning of the Disease, another in the increase, and another when 'tis inveterate; whence also the signs of this Disease, beginning, encreasing, inveterate, are wont commonly to be delivered. And truely to know this Disease when 'tis Inveterate, is not very difficult, as

shal

shal be said by and by: but whiles it yet lies, and is in the first blade, then to know it is not so easie. For as plants and trees when they are at ful growth, are known by the vulgar, but to know them at their first appearance, is the part only of an artist and good herbarist. So also this Disease, when it discovers it self by diverse Diseases, and Symptomes, 'tis known even by the vulgar, but when it lirks in obscurity, 'tis not discovered but by experienced Physitians.

The signs of the veneral disease in its beginning.

Yet there are some signs, which may discover this Disease, even at the first beginning; the first is, that they who are taken with this Disease do presently (without the appearance of any signs of a Feaver imminent) perceive a kind of weariness and heavines in their whol body, and somtimes a drowsines after sleep. There is a vehement and wandering pain, which is felt somtimes in the Head, somtimes in the Muscles, somtimes about the joynts, and this pain is more troublesome towards night than at other times of the day. The fresh color of the Face is changed strangely, and some write, that there is a Livid circle appears under their Eyes, such as we usually see in Women that have their Courses: there is added to these a sadnes, fear, and those that before were merry and jesting, become sad and pensive without any cause. All which signs are of greater force if the signs of the Veneral Disease did go before, and vanish without any convenient, and sufficient means. And truely if this evil be contracted by Copulation, and hath not yet plainly possest the Liver, but sticks yet in the Privities, then chiefly this Veneral Disease at its beginning, discovers it self by the running of the Reins, Ulcers in the Privities, and buboes, for when that Malignant vapor, is first of al communicated to the Testicles and genital vessels, the seed is corrupted, and the generation of seed is depraved in the genital vessels: whence instead of good seed there is generated a stinking and corrupt Humor, which doth irritate Nature to expulsion. From whence also the Gonorrhæa, although improperly so called, is easily distinguished from that running of the Reins which is not French, becaus this gallical is joyned with a great heat, and pain, somtimes also with an Inflamation of the Testicles, and Vessels resembling a varix; the matter which is cast forth is far different from seed, viz. Yellow, green, Acrid, corroding the glans; neither doth it yeild to those Remedies, with which a true Gonorrhæa is cured. Next of all there appeare pustles in the Privities about the bigness of a grain of Millet, and somtimes they compass the whol Ring, which when they are broken, there remain white Ulcers which in process of the Disease grow deep and callous, of divers colors, and with pain joyned with them. Thirdly, also Buboes show forth themselves in this Disease; for though somtimes the Buboes do precede an Erysipelas or a Rose, yet then there went before those causes which do effect a Rose, as fear, frights, anger, and the bubo is extended towards the Thighs, as it were by a red line, and a little after the Erysipelas breaking forth, it vanisheth; but if the Bubo be Veneral, 'tis not extended according to the longitude of the Thigh, but rather obliquely, and imitates the situation of the spermatick Vessels. For in unwholsome Copulation the seminal vessels are easily first of al infected, which whenas they have their Original from the Vena Cava not far from the Liver it self, that virulency is easily communicated to the Liver, which being affected drives it back again by the same waies from it self, from whence are caused both the Buboes, and the running of the Reins. And thus these two Diseases are for the most part complicated, and being Joyned are a sure sign of the veneral Disease, and one failing, the other is of force; but if this evil be contracted without whorish Copulation, and if by kissing, there are Ulcers raised about the mouth, if by giving suck to an infected infant, there are inflamations about the breasts, pustles, and clefts; if from Garments and common lying together, there are pustles every where raised in the Skin.

But

The signs of this disease increasing.

But if the evil do now increase, and grow more grievous, and the virulency it self be already communicated to the Liver, and thence the nutrition in the whol body be depraved, diseases and symptomes of al kinds, such as were reckoned up before, *cap.* 2. in the history of this disease, do arise, which indeed though singly by themselves they afford not a proper and inseparable signe of this disease, yet if they be taken together, and their peculiar condition be diligently considered, they may clearly enough detect this evil. For there is scarce another disease, in which there is a concourse of al these, nay there are many of them so proper to the Veneral disease, that they are found in no other disease after that manner. How the buboes which are seen in the beginning, and sometimes in the increase of this disease, may be distinguisht from other buboes, was said even now; the veneral pustles are some of them crusty, others without a crust, the crusty are chiefly the signs of this disease, and sometimes they are eminent, that in the head and forehead they resemble the horns of a Ram, under which sometimes is contained matter. Somtimes none, and they appeare in the face, head, beard, whol body, but especially about the privities and hips. And *Fallopius* writes that these kinds of Veneral tumors, may be distinguished from those which are not Veneral after this manner; That the Veneral if they be rubbed and the skin taken off, three daies after they appear unchanged, but benign pustles if they be rubbed, are increased by the attraction of blood, and that good, and alimentary. So the the tumors which are commonly called Gummosities, if they be joined with a swelling, or do firmly adhare to the parts void of flesh, and the bones, especially if they be in the head, forehead, in the fore part of the Leggs, are a most certain signe of the Veneral disease: for the Veneral matter hath an eating virulency even in a crass humor, and joined with paine, the like of which is not in other tumors, which do proceed from a thick matter. But though ulcers do happen also in many other diseases; yet if they rise chiefly in the yard, and especially on the foreskin, and about the nut, and towards the end of the yard, or also in the mouth and palate, the uvula or jawes, and those to putrid and stinking, and there was no inflamation of those parts precedent, nor signs of the scurvy, they are also signs of the French Disease; also the falling of the hair causeth no light evidence of the disease; for if after childhood, no other disease foregoing, which is wont to be accompanied with the shedding of the hair, the hairs of the head, and especially of the beard and eye-brows fal off, and also there appear ulcerous pustles, or a filthy Scab, this is altogether a sure signe of the French Disease. In like manner Chapps and clefts in the Palms of the hands, and soles of the feet, if no other cause preceded, are an undoubted sign of this evil, so also those bunches sometimes low and broad, somtimes somwhat long, and those excrescencies which they cal ficus, condylomata, and crusts, if they appeare in the privy parts, or about the Arse-hole, do surely enough discover this disease; pains of the head, although they happen in many other diseases, yet if their bunchings out, and gummosities in the skin, if there was a Gonorrhea and it be stopped, if a bubo and it be vanisht, those also are sure signs enough of this disease; paines also in other parts may likewise discover this disease, for if the paine be not in the very joints, but in that part which is in the middle of the bones, and neer to the Joints, as upon the skin, or upon the shoulder bone, which is between the head and the joint of the elbow, and they be most cruel and sharp, and are exasperated towards the evening and night, they are also sure signes of this disease. There is familiar also with this disease, such a distillation, by which there is emptied by the mouth, and nose, much flegm and watrish matter, by which the parts through which they pass are exulcerated; but in the first place the sure signe of this disease is that French Gonorrhea, of which was spoken before. Last of al this also is a sure signe of this disease, if the aforementioned diseases and symptomes be not taken away, or made more gentle, by medicines that do work by manifest qualities, applyed according to art, but rather do grow worse, but are mitigated by those proper and specifick remedies.

Least

Last of al, if this evil be inveterate, diseases and symptomes of al kinds may happen, callous, fistulous, and cancerous ulcers, knobs in divers parts of the body, rottenness of the bones in the Leggs, Armes, especially in the Skul, the bone of the Palate and Nose, a Hectick Feaver, Consumption, Pthisick, evil habit of the body, Falling-sickness, falling of their teeth, Deafness, Blindness. *Vidus Vidus, lib. 2. de curat. membrat. cap. 18.* reports that he saw at *Barciconia* a Spanish Souldier, who by the French Pox suffered a rottenness of Skul, and afterwards fel into an epilepsy, that filth distilling from his rotten skul, and pricking the membranes of his brain, from which notwithstanding he was freed by cauterizing his Skul with a hot Iron; and *Forestus lib. 7. Observat. 9. in schol.* relates of one infected with the French Pox, though he seemed to be wel cured, yet was afflicted with a long and continual paine of his head, which could be cured by no remedies, til at last his Skul being opened, there was found under it, upon the dura mater somwhat black like a wevil, which worme when it was taken away, that pain ceased, nor returned no more. And *Johannes Schenckius ex* D. *Georg. Garneci observat.* relates of one sick of the French Pox, that was il cured, who was taken with a great inflamation in his palate, in the five-like bone, in his uvula, and al the neighbouring parts, which presently turned to a Gangrene, and that to a cancer, that every day he voided somwhat, of those corrupt and putrefied parts, and the uvula, and next parts, being first of al cast forth, at last he spit through his mouth his very brain with a most noysome stink. And *Felix Platerus, lib. 1. observat.* makes mention of an Abbot who by the French Pox was made blind, deaf, and dumb, who could no otherwise understand and perceive the meaning of others, but if they with their finger or a peice of wood drew letters, expressing some sentence upon his bare arme, from al which singly perceived he made a word, and from many words a sentence: God the just Judg doth sometimes punish wandring lust, with so grievous and horrid a punishment. *Signs of an inveterate Pox.*

As concerning the differences of this virulency, although its formal essence be unknown, yet there is a certain difference. According to its manner of acting and its vehemency, which is known from its effects; for sometimes more, sometimes fewer: sometimes the contagion and active power is great, sometimes less: and *Eustachius Rudius* reports *de morb. occult. lib. 5. cap. 10.* that he knew some whores infected with so powerful a French Poyson, that al who had to do with them were not only presently infected with the same evil, but were wholly possest with most grievous symptomes, which could not be removed nor mitigated, by any remedies, or art, nay some of them not long after died. But we know the vehemency of this evil, if as was said even now, some be presently infected, if the pain be most cruel, if the erosion pierce to the bones, if many putrid and stinking excrements proceed every where from the body. For by how much the evils are the more, and more grievous, by so much the power of this virulency is the greater. *Signs of the differences.*

CHAP. *VII.*

Of Prognosticks.

But that we may know, what hopes there is concerning the event of this disease, we must enquire whether the disease is like to be short, or long, whether easy or hard to be cured, and at last what end it shal have.

But first of al concerning this disease, 'tis wont to be questioned amongst some Physitians in genera., whether it shal once have an end? *Fracastorius* indeed did hope for it, as was said before, and thought, that even in his time this disease grew aged and that a little while after it would wholly die, chiefly for this reason, because he thought it was epidemious, and took its original from the Starrs, which impressions of heaven do not last alwaies, but in process of time are changed, and because he *Whether this disease shal cease.*

saw

saw this disease did grow more mild. For as *Jul. Palmarius* writes of this subject *lib.* 1. *de lue Vener. Cap.* 5. it was reported, that this disease at its first rise was so filthy, that that which reigns now is scarce thought to be of the same kind; for there were innumerable ulcers, rough and standing out, in the figure and bulk of an acorn, a filthy humor flowing from them, and such a stink exhaling that his nose that it reached, was beleeved presently to be infected. The colour of the pustles was between black and green, as much tormenting the sick with the sight of them, as with their pain. Therefore al people did shun the sight of them, and so abstain from touching them, as in no disease besides. But *Fracastorius* his hopes deceived him, for as yet we do not see this disease grow old, much less cease, and though the filthiness of the ulcers and pustles be more tolerable, yet in pains and torments it is grown more cruel, as the same *Palmarius* writes. It is more likely, that as long as those copulations and conversings with infected people, and wandering lusts shal indure, so long also this disease wil last, and be propagated by contagion. For such is the nature of this poyson that it doth not suddenly kil a man, in the interim those who are sick of that disease, are infectious those waies, of which we spake before. Whenas therefore there are every where many, who are poluted with that disease, and others converse with them, there is yet no hopes that this disease should cease ere long, whenas the effect doth not cease, unless the cause be taken away. Neither is that reason firm enough, which some who are of a contrary opinion do alledg; for they say whenas this disease is a contagion preternatural and violent, it must necessarily have an end, whenas those things which are preternatural and violent have not perpetual causes, and therefore must needs cease to be; but the answer is easie; nothing indeed that is preternatural and violent, is of it self perpetual, yet if the cause be perpetual, that also may be perpetual. Therefore though as the plague is sometimes extinguished, so this disease also might be, if the same diligence were used, which is in preventing and curing the plague, as was said before: yet because there are alwaies men, who are sick of this disease, and can infect others, and others do not abstain from their society, even this disease shal continue so long, as that contagion shal last. And therefore *Eustachius Rudius* rightly of this subject, *Lib.* 5. *de Morb. occult. Cap.* 11. writes, if there were one prince of the whol world, or one conspiracy of many of them against this disease, by the help of physitians this disease might be wholly rooted out; viz. if they who are sick of this dilease, were al committed to physitians to be cured, in the interim were removed from the society of other men, and the same were done with the infected with this disease, as is wont to be with those infected with the plague or leprosie, there were hopes this disease might be extirpated; & for this cause too, because the Veneral disease is not contagious at a distance as the plague is, but for the most part is communicated by copulation, sometimes by kissing and garments. But here is no diligence used, and as the same *Rudius* saith, Theeves, robbers, and murderers, and other wicked persons are sharply punished, but publique whores ful of this disease, and who daily destroy more than a thousand men, & polute whol Families and Cities, are cherisht, smoothed up with flateries, and kept gallantly. But leaving these, let us see what may be foretold of every particular diseased patient.

Prognosticks.

1. The Veneral disease for the most part of it self, is a disease of long continuance, for this reason, Because the liver principally, and the nutritive faculty is infected in it. But *Galen* teaches rightly, 5. *de lo. affect. Cap.* 2. That of diseases of the heart al people die most speedily, of affects of the brain more slowly, but the life is longer protracted when the natural actions are hurt; and though the veneral disease be also malignant, and is not undeservedly reckoned amongst poysons in its kind, yet its power in acting is far slower, than that of other poysons: yet the vehemency or weakness of this poyson in this or that body, and the disposition of the body, may make somewhat to the length or shortness of this disease; for if the poyson be more vehement, the disease is the more dangerous, as shal be said by and by: if also the body before did abound with vitious humors, the evil is

increased,

increased, and made longer: and indeed sometimes the stubbornness of this disease is such, that though it seem sometimes to be wholly extinct, yet it hath been observed that it hath sometimes grown freth againe after many, nay, thirty years, as was said before.

2. But whether this disease wil be hard or easie to cure in any patient, must be judged from the greatness of the disease, and strength of the patient, as in other diseases. First of al, as concerning the nature of the disease it self, though this disease be far more gentle, than other venenate diseases, yet because it is not of the number of them which depend on manifest distempers, but malignant and contagious, it may infect al the humors in the whole body, nay it may pollute al the Similar parts, and hence it is hard to be cured.

3. Yet this disease when 'tis new is easier to cure, than when 'tis inveterate; for in that new malignant quality, it only affects those parts, by which 'tis propagated and for the most part the privities, but in the inveterate disease, that very malignant quality is imprinted also on the liver, and from the liver again is communicated to the blood, and by the blood to al similar parts; for it is false, as appeares out of those things which have been formerly said of the nature of this disease, that the liver here is hurt in sanguification, by no disease, but only by reason of an evil object, which mixt with the blood and other humors, does pollute them, deprave and make them vitious, and convert them into its own nature: indeed 'tis not to be denied, that vitious humors also do corrupt the good, in the interim from good chyle also in a liver evil disposed is generated bad blood, which appears even from this, that through every part the nutrition a little while after is infected through the whol body, which could not be, unless the liver were hurt.

4. *Epiph. Ferdinandus* writes, Hist. 17. That he hath learned by experience, and that other physitians have observed the same, that those who being once cured are again infected with this disease, are either never, or with a great deal of difficulty recovered.

5. Although the nature of this virulency doth not consist in any manifest distemper, yet if it light on a body hot and dry, and especially endewed with a hot distemper of the liver, 'tis more difficultly cured. For whenas pock-wood, Sarsaparilla, and the like, are hot and dry, that hot and dry distemper is increased, and so, though this very disease be not increased, yet another damage is brought upon the body, and whenas those proper medicines cannot safely be administred, unless the body before were very wel purged, by these means 'tis heated and dryed the more.

6. For the same cause, a hot and dry season of the yeare, as that of the summer is, is not so fit for the cure of this disease, whenas the strength is then Exhausted.

7. If also the strength be feeble, that it cannot undergoe those strong medicines which are necessary, or if the sick, out of custom or peevishness, wil not admit of necessary medicaments, 'tis made hard to cure.

8. If also a feaver, or consumption, or other grievous symptom, or disease be joyned, which may hinder the cure, the disease cannot easily be removed, as was said even now, of a hot distemper of the liver, and of the whol body.

9. If there appeare in the joynts, callous, Schirrous, and hard tumors, and those commonly called gummosities, the evil is hard to be cured, and is not rooted out, by most powerful remedies: for such tumors never appear, unless the evil be inveterate, and hath taken deep root, most of which are fixt in the bones under them.

10. Buboes in the groins if they be hard, and are not easily suppurated, and those which sometimes break forth, sometimes vanish, are hard of cure, because they signifie a stubborn matter, and a weakeness of nature in expelling it: but if they be easily suppurated, and the strength be firm, and especially the liver strong, they are ar-

guments of a more benigne Diſeaſe and matter; and ſuch Buboes, if they be kept open along while, may bring perfect health.

11. A roughneſs of the jaws which is attended with hoarſneſs, or an obſcure, or no voice, do ſhew the evil to be antient and ſtubborn, and which wil ſcarce be cured.

12. Ulcers that are new in the Yard are eaſily Cured, but in the Arſehole, or about it, made difficultly, for they ſhew the evil is now inveterate: and ſuch Ulcers are continually moiſtned by the Excrements, and Medicines cannot conveniently enough be applied to them.

13. Ulcers alſo in the joynts and other parts are moſt hard to cure, becauſe they ſignifie an evil now inveterate, and which hath invaded the whole body.

14. Ulcers in the mouth and jaws are not eaſily cured, becauſe alſo they argue the evil to be ancient, neither can convenient Medicines be applied to them, and they are continually moiſtned, by the Excrements falling from the brain.

15. If the bones of the noſe be eaten, and there be alſo a ſlow Feaver, it ſignifies an evil incurable, whenas now the diſeaſe is communicated to the brain it ſelf, or its Membranes.

16. Bunchings out in this diſeaſe, eſpecially the broader, are not eaſily cured, and they argue an evil hard to be cured.

17. The colour of the Skin depraved, and the falling of the hair, if convenient means be applied, are not very hard to cure.

18. Pains eſpecially in the Head, and upon the Shins, are oftentimes very ſtubborn, that they yeild to no Remedies, or at leaſt not under a long time.

19. Vertigoes and falling ſickneſſes are moſt grievous and pertinacious, for they ſhew that the Veneral Virulency, hath now poſſeſt the brain it ſelf.

20. Diſtillations alſo are laſting, becauſe they alſo happen, only when the evil is inveterate, and the brain is affected; the which are more dangerous and grievous, if they fal on the breaſt and Lungs, and exulcerate them.

21. Alſo the noiſe in the Ears is for the moſt part laſting, and ſcarcely removed, whenas there are divers windings in the Eares, and their expulſive faculty is weak, neither can medicines penetrate thither.

22. The running of the Reins alſo for the moſt part is laſting, or if it be ſtopt grievous evils are wont to follow, and moſt heavy pains of the Head and Joynts.

23. But chiefly the Nature of the Contagion it ſelf, from which the ſick contracted the diſeaſe, doth manifeſt the force and greatneſs of the diſeaſe; for this poyſon hath ſomtimes a greater, ſomtimes a leſs activity, and Phyſitians do relate who have often had ſuch Patients in cure, that ſomtimes of ten ſtrong yong men, who have had to do with the ſame Whore, not one of them hath ſcaped, therefore if it be known, from what he or ſhe, this evil was contracted, the Phyſitian may the eaſier judg of the event of the diſeaſe.

24. Other things being alike, this evil is eaſieſt cured, which is contracted by Whoriſh Copulation, but that is harder to Cure, which the Infant hath ſucked in with the milk, whenas the virulency goes into the ſtomach with the milk, and hence in the Liver there is generated a virulent blood, which afterwards runs through the whol body, and Pollutes that. But the Hereditary evil is hardeſt of al to Cure, and that which is communicated from infected Parents, with the Seed and blood.

25. As for the parts affected, if the Liver only be affected, the evil is the eaſier Cured, whenas it hath a ſtrong expulſive faculty, and Medicaments can eaſily penetrate unto it: but the Spleen, Kidneys, Womb, and external joynts are not ſo eaſily Cured, but hardeſt of all the Brain, and the Lungs, becauſe they have a weaker expulſive faculty, and Medicaments do not eaſily penetrate thither.

26. From al which 'tis eaſily collected, what wil be the event of the Diſeaſe, for

by

by how much the more, and more grievous diſeaſes and Symptomes are joyned with the Veneral diſeaſe, by ſo much the more the ſick are indangered; by how much the fewer, and lighter, by ſo much the leſs: and thoſe chiefly die, who to their putrid and Malignant Veneral Diſeaſe, have ſupervenient thoſe Feavers they call Gallical; for the Veneral Virulency whiles it corrupts the Humors, and induceth a Malignant quality into them, makes the Feaver worſe, and alſo debilicates the innate heat, whence neither the Feaver, nor that Malignant diſeaſe can be overcome by Nature.

27. Very many alſo die of a waſting of the body, and a hectick Feaver, or rather a ſlow, and putrid one: for both the Veneral virulency it ſelf, and the pains, watchings, and other ſymptomes do debilitate the innate heat, hurt nutrition, whence follows a waſting of the whol body, to which is joyned a ſlow putrid Feaver raiſed from the evil Humors.

28. Sanguification alſo being hurt, ſome die of a Dropſie.

29. Many alſo die by reaſon of Catarrhes, falling down on the jaws and Lungs, hindering and taking away their breath; or the Veſſels of the Lungs being eaten by a ſharp Catarrhe, and firſt of al ſpitting of blood being raiſed, then a Phthiſick, they die.

30. Somtimes the Veſſels being eaten in two by the acrimony of the Humors, and Vomiting of blood cauſed, the ſick die by too great a Flux to the ſtool, or by the Womb.

CHAP. VIII.

Of Prevention.

Prevention

WHenas 'tis ſafer to prevent a Diſeaſe, than to cure it, ſome Phyſitians endeavor to teach, by what means one may keep himſelf clear, though he have had to do with an infected Woman. Of which buſineſs *Fallopius* treats in the whol Chapter, 89. *de Morb. Galli.* and he writes that he ſhould ſeem to have done nothing unleſs he teach, how one ſeeing a handſome Woman, and lying with her though ſhe be infected, may be preſerved from the French Diſeaſe: and he cals the immortal God to witneſs, that he hath made tryal of it in ten thouſand men, and none of them was infected: and he propounds there two medicaments, by which the Contagion received may preſently be drawn forth, diſſipated, or dryed up. *Hercules Saxonia*, propounds the ſame, *de lue Vener. cap.* 16. and does very much commend them, and as *Aurelius Minadous* ſpeaks of this buſineſs, many confide that being guarded with thoſe Medicines as with a buckler, they may enter the moſt infected whores, and freely ramble al the world over. *Euſtachius Rudius*, alſo propoſes the like Medicaments, *Lib.* 5. *de morb. occult. cap.* 13. But indeed I do not beleeve, that thoſe things can be taught with a good conſcience, by which ſo many men are encouraged to luſt, whom perhaps the fear of this Diſeaſe might have frighted from it; and therefore we wil ſay nothing of theſe Medicines; but *Aurelius Minadous* thinks they themſelves are deceived, that teach ſuch things, *Cap.* 31. *de Virulentia Venerea.* Where he overthrows *Fallopius* foundation, who thinks that this Diſeaſe is only communicated by the leaſt purulent bodies, which if they be wiped away, extracted, diſſipated, this Diſeaſe may be turned off, and he teacheth that the Contagion doth not only enter by the external parts of the Privities, but alſo chiefly by the internal, and runs through the Body, and that the infected Vapors, and ſpirits do paſs through the internal poroſities, and are admitted by the Veins; and therefore no man can promiſe himſelf health and ſafety from waſhing, which only reaches to the external parts, nor from other Medicaments outwardly applied, neither can ſuch external Medicaments take away the Pollution conceived within. The ſafeſt way therefore to avoid this Diſeaſe is to abſtain from whores, and to

remember that Whoremongers and Adulterers the Lord wil judg, who yet is wont alſo to puniſh them in this Life, with that moſt filthy Diſeaſe.

Yet *Jul. Galmarius*, hath another way of prevention of this Diſeaſe, to wit, by internal Medicaments, and he writes that he hath found out an antidote or a Mullet, by the uſe of which mens bodies are rendered ſafe againſt this Diſeaſe, yet he entreats and conjures al Phyſitians and Chyrurgeons, that they do not communicate and make known that Medicine in obedience to luſtful people, and that they make not themſelves foſterers of luſts, but to them only who muſt neceſſarily converſe with thoſe that are ſuſpected or defiled. But he deſcribes that Antidote, *Lib. 1. cap.* 8. and this is it.

Take *of the Amulet for the Pox, and of old Mithridate, by* Galens *deſcription, of each ſix drams; Conſerve of the flowers of Bugloſs, of broom, of Roſemany, of each three drams; mix them, give one dram, or a dram and an half, or two drams at the moſt, in the morning two hours before meat, eight or ten daies together.*

But if any one ſuſpect himſelf to be infected, he admoniſheth that he earneſtly uſe a greater care for prevention: therefore let him take of the Alexipharmacal Medicine even now deſcribed, ſwallowing a dram, or a dram and an half in the morning and before ſupper, for eight or ten daies together, whoſe Vertue that it may reach the eaſier to the more remote parts, when they have ſwallowed it, 'tis expedient they drink preſently after it ſomwhat of this Julep, by which as its vehicle it may be carried into every part.

Take *of the water of bleſſed thiſtle, burnet, Devils-bit, of each two ounces, of Syrup of the juyce of Sorrel, of Lemmons, of each an ounce and an half. Make a Julep for two doſes, to be drank preſently after the taking of a dram and an half of the Amulet, in the morning, and two hours before ſupper.*

But whenas al thoſe ſimple Medicaments, which are in that Antidote, are not proper to this Veneral Diſeaſe, we muſt conſult with experience, whether their vertue be ſo great, as *Palmarius* cries it up for.

CHAP. IX.

Of Indications.

Indications THoſe Indications which are in other diſeaſes, are found alſo in this; to wit, That which is taken from the Diſeaſe, called in ſpecy Curative: That which the cauſe doth afford, Preſervatory, whether alſo are referred urgent Symptomes; and laſt of al the Vital, for they deſervedly challenge a place in this diſeaſe, yet in the explaining of them Authors vary much, and as every one thinks of the Nature of this Diſeaſe, ſo alſo he teacheth concerning its indication and cure. We inſiſting on thoſe things which we have formerly prepoſed of the Nature of this Diſeaſe, and have ſtrongly proved, think thus of indications in this Diſeaſe.

Firſt of al, whenas this Diſeaſe is occult, and Malignant, chief enemy to the Liver and nutritive faculty, therefore it affords a kind of genercial indication, but no ſpecifical and profitable one can be had from thence, and therefore only experience, which hath found out Medicines working by an occult quality, hath adminiſtred profitable Medicines in this Diſeaſe: and unleſs the Spaniards had received from the Indians ſuch Medicaments, as Lignum Sanctum, Sarſaparilla, China Root; and the boldneſs of Chyrurgions, and eſpecially *Jacob Carpus*, had not fallen upon the uſe of Mercury, either by chance or by argumentation, whiles they read that *Avicen*, *Meſue*, and *Theodoricus*, made uſe of quickſilver, in certain puſtles, and a cruſty Scab, perhaps even to this day the true Remedies of this Diſeaſe would lie hid. But though the Remedies of this diſeaſe, were not found out ſo much by indication, as by experience; yet a Method in curing of it is not wholly excluded, but hath its

place

place also, whenas 'tis necessary that those Medicaments found out by experience be rightly applied; and besides also Tumors, Ulcers, and the like Diseases springing from the corruption of Humors, have their Method, by which they are cured. Yet in this case we must have a care, that we do not look more on the manifest qualities, and known diseases, than on the occult Nature of the disease, in which business notwithstanding many do fail, who are tedious in curing of divers distempers, preparing the Humors, and directing their cure to these or those diseases. Whenas yet 'tis plain by experience, that in a hot, and in a dry distemper, and in an exustion of the Humors, as they speak, and in a Consumption it self, we do most happily use pockwood, and the like hot and dry things, and the Malignity being overcome, the rest do easily vanish.

Secondly, as concerning indication preservatory, here we must chiefly have respect unto that Malignity and virulency imprinted on the Humors, and that is to be destroyed by proper and Alexipharmacal Medicines. Yet if there be any other faults in the Humors, it wil not be unprofitable also to mend them. And whenas the body is either burthened with a Plenitude, or abounds with vitious Humors, the malignity is the easier disseminated into it, and there is more plentiful matter prepared for putrefaction, and the force of the Alexipharmacal means is dulled, it is expedient to empty either the superfluous blood, or the vitious Humors, that the other Medicines afterwards may be administred more safely, more commodiously, and with greater benefit. *Preservatory.*

Thirdly, the Disease and various Symptomes, which supervene to the principal disease, and arise from the corruption of Humors, are al to be removed in their proper manner. *Curative.*

Fourthly, the strength is to be preserved, for as no other disease can be cured, unless there be strength of body, so nor this; and al attempts are in vain, unless at leastwise we have Nature willing. *Vital.*

And so there are four things chiefly to be done in this disease: First of al, if blood abound, that must be diminisht, and if any vitious Humors abound, they are to be prepared and emptied, and if there be any manifest diseases, which may be an impediment to the proper Cure, as obstructions and the like, they must first of all be taken away. Secondly, the Malignity and virulency as wel that inherent in the humors, as that imprinted on the parts, and principally the Liver, is to be destroied by the proper Alexipharmaca of this disease. Thirdly, the strength is to be preserved and confirmed, and first of al chiefe care is to be had of the Liver, which suffers in this disease. Fourthly, the diseases and Symptomes which are wont to be joyned to this disease are to be taken away. *Four things to be done in the Cure of the Veneral disease.*

Here we must clear a controversie, to wit, Whether this disease may be cured without sweating? Some are of this opinion, That this disease may be taken away, though sweat be not provoked: And first of al they prove it thus, Because this evil consists in a certain hidden quality which cannot be taken away but by alteration of the body, whenas contraries are cured by contraries: but that alteration may be affected by the proper vertue of antidotes and decoctions administred, without sweating. Next of al they alledge experience, by which it is evident, that by the taking of such Medicaments, some have recovered without sweating. Thirdly, they urge this, That those that drink the decoction of the wood are somtimes happily emptied by nature, by urine, by the stool, and not alwaies by sweats. *Whether the cure may be perfected without sweating.*

Aurelius Minadous, contends against these, *de Virulen. Vener. Cap.* 39. And first of al he writes that he never observed, that Physitians commanded the decoction to be taken without sweating, to which al Alexipharmacal things of their own Nature do incline men, neither is the matter it self unfit to be expeld this way, being Vaporous and halituous: neither was there ever any one, who did throughly and wholly overcome this disease without the help of some sweating, especially if it were inveterate; but why he holds thus, he brings this reason, That in his opinion, the essence of this evil doth not consist in a quality, but in the body

affected

affected with an evil quality: and therefore he holds, as a quality doth indicate alteration, so a body indicates Evacuation, which though it may be many waies, yet most commodiously by sweating: whenas this very thing is a Vaporous body, and is most rightly and easily discussed by sweat; and he adds this, whenas there is a great quantity of Excrements abounding in those bodies infected with this disease, not only in one part, but al over the body; but sweat is an universal Evacuation, they are most commodiously emptied by sweating: and he holds that sweats do very much profit the Liver especially. For whenas that is the Forge of Humors, which are carried through the whol body, and they are purged by the benefit of sweat, and freed from al defilements, also the Liver polluted may be this way cleansed, and though Nature somtimes do empty the virulent humors by some other part, as by stool, or by Urine, and then her endeavor is not to be hindered, but to be helped forward; yet he holds that without sweating the whol body cannot be freed from that Disease, and he thinks that sweat only can empty from al places both internal, and external, quickly, safely, and pleasantly.

The decision But neither of these opinions doth fully reach the Truth, and both delivers an imperfect Cure. For whenas the Curative indication so called in general, is twofold; the one preservative, which is taken from the cause; the other in specy called Curative, which is taken from the Disease; they who think this disease may be cured without sweat, because it consists in a certain hidden and Malignant quality, think right concerning the curative indication, whenas that malignant quality cannot be taken away by sweating, or other Evacuations, but by proper Alexipharmaca, yet they neglect the preservative indication, and the cause: for whenas it is certain, that in the Veneral disease, there is not only a vitious disposition, and Malignant, in the parts, especially the Liver, but that al the Humors of the Body are corrupted; there is required then an Evacuation of them, which is most commodiously done by sweating, as *Minadous* rightly proves. For though something be discussed insensibly, yet that insensible Evacuation is not sufficient, and 'tis too slow. But *Aurelius Minadous*, thinks wel concerning the taking away of the Cause, and the Evacuation of vitious Humors, which is most rightly done by sweating; but he neglects the disease it self, or that Malignant quality, imprinted not only on the Humors, but also on the Living parts: from which it appears, which is diligently to be taken notice of, that the dispute of occult diseases, is not amongst those which *Galen* calls Logical, but does conceive the very essence of these diseases, and that the ignorance of the occult diseases, doth not only breed Errors in theory, but also in practice. Therefore though we do grant, that the Evacuation of Humors is wel ordered by sweating, yet Alexipharmaca are necessary also, against that malignant disposition in the parts, especially in the Liver, and *Fernelius*, whom *Palmarius* follows, for this very cause do add peculiar Alexipharmaca, as shal be said, that that Malignant disposition may be pulled up by the Roots. For though al the vitious Humors be emptied, and al other diseases and Symptomes do cease after their emptying; yet unless that Malignant disposition be taken out of the parts, the evil grows fresh again, and oftentimes a long while after. And this I think is the cause, that not only the decoction of Pockwood, Sarsaparilla, and the like, is given in the morning to provoke sweat, but also without sweating is taken as common drink; for the very same proper Medicines, which do destroy the occult cause and malignity in the humors, and do empty the vitious humors by sweat, are able also to Eradicate the disposition imprinted in the parts.

Last, of al this must not be past over, that the indications proposed before, are not necessary to be observed in every French disease, but only in that, which hath almost invaded the whol body, and especially hath possessed the Liver. But if the evil be new, there is no need either to let blood, or to give purges, whenas the fault is not yet communicated to the humors, but it is enough to wipe off, or cal forth the contagion received, which also is sufficient in the scab newly contracted by contagion, where yet we must observe, whether those pustles, and French rottenness, as

they

they cal it, do immediately proceed from contagion, and whoriſh copulation, for then external medicines do ſuffice, or whether they do ariſe from the Liver now affected, for then there is need of evacuations and alexipharmaca.

Chap. X.

Of the Cure. And firſt of bleeding.

FIrſt of al therefore as concerning indication preſervative, or the removing of the cauſes, and bleeding at the beginning; truly the cauſe of this diſeaſe properly and next of al is not taken away by letting of blood; yet if blood do abound in the body, and that eſpecially be too hot, the proper remedies of this diſeaſe, which are hot and dry, cannot be ſafely adminiſtred unleſs the abounding blood be firſt diminiſhed.

And truly if the virulent matter have no peculiar motion to any part, the baſilick veine may firſt of al be opened: but if the matter have motion to ſome particular part, as to the groin, and nature thruſt forth a bubo, bleeding is warily to be uſed: for if the bubo tend to ſuppuration, we muſt not let blood, and eſpecially in the Arme, leſt nature be troubled in her expulſion, and the matter be recalled to the inward parts. And it hath been obſerved, that many from the bubo opened, and the matter a long while emptied by it, have become perfectly ſound; on the contrary from unſeaſonable bleeding, the evil hath been prolonged; therefore in bleeding we muſt attend the motion of nature, and when the tumor doth not afford hopes of ſuppuration, a veine muſt be opened in the lower parts, for ſo the the matter is retracted towards the lower parts, and by reaſon of the efflux of hot blood, 'tis afterwards more eaſily ſuppurated. After the ſame manner a veine is to be opened in the yard, if there be rottenneſs in the privities, or a running of the Reines, and wholly if the parts below the Liver be affected: but if the matter ruſh to the head, and there cauſe moſt vehement pains, filthy ulcers, falling of the haire, the cephalick veine in the Arme is moſt commonly opened.

The other precepts which are propounded in general concerning the right adminiſtration in bleeding, are here alſo to be obſerved; which whenas they are not proper to this affect, we ſhal no further propoſe them here.

If the ſtrength wil not beare bleeding, inſtead thereof the hemorhoidal veines of the Arſe, may be opened, or Cupping-glaſſes be applied in convenient places.

Chap. XI

Of the preparation, and purging of vitious humors.

Preparation and purging of humors.

NExt of al if the body be cacochymical, the vitious humors muſt be emptied and prepared with convenient medicaments; whenas in an impure body alexipharmacal meanes, and proper remedies of this diſeaſe, do profit little, nay they may bring hurt, and though that diſeaſe be overcome, may render the body obnoxious to other diſeaſes. For vitious humors collected about the bowels cannot al be diſcuſſed and diſſipated by ſwear, but the thinner part being diſcuſſed the thicker is left, and grows dry, and is faſtened in the bowels, and oftentimes contracting an acrimony, doth weaken the ſubſtance of the veſſels: from whence that diſeaſe grows ſomtimes more ſtubborn to cure, and there ariſe obſtructions of the Liver and Spleen, and ſchirrous tumors, hypochondriacal diſeaſes, and creeping ulcers.

Nor yet is purging only to be uſed in the beginning, and before the proper cure of the diſeaſe, but alſo the whol time of the cure, if vitious matter be collected again,

'tis

'tis to be emptied by intervals: yet if the evil be now inveterate, and ſtick principally in the external parts, the vitious matter is not rathly to be recalled to the inward parts by ſtrong purgers, leaſt the Liver, Stomach, and other bowels be hurt and weakned, but 'tis to be emptied by convenient places, where nature tends.

But concerning the preparation and purging of humors, though many Authors are large enough, yet whenas thoſe things which are ſpoke by them, concerning an univerſal preparation and purging of humors, are not proper to this diſeaſe, but are common to al depending on a cacochymy: it ſeems not worth our labor, to dwel upon thoſe generals, which are already known by the cure of many other diſeaſes. We ſhal only admoniſh you of theſe things; firſt of al when the diſeaſe is new, we muſt obſerve, what vitious humors abound in the body, and eſpecially in the ſecond region, and thoſe muſt be prepared and emptied. But if the evil be now inveterate, becauſe in that for the moſt part, thick and aduſt humors are collected, the medicins are firſt of al to be directed againſt them. Next of al this is to be obſerved, that we have reſpect alſo to the diſtemper of the bowels, and if they have contracted any diſtemper, that muſt be corrected, and they muſt be ſtrengthened with proper medicaments. Thirdly, it is neceſſary, that we alwaies ad ſomwhat to our preparatives and purgers, which doth reſiſt the Veneral virulency by a ſpecifick faculty; and therefore concerning common purging medicines we wil ad nothing, whenas they are every where obvious and known, but this that many phyſitians do teſtify, That Mechoacan, to which belongs Jallop, is given not only for its purging faculty with benefit in this diſeaſe, but alſo becauſe 'tis an enemy to this evil by a peculiar power, ſo that it is numbered by ſome amongſt the antidotes of this diſeaſe. Then by the Chymiſts mercury prepared is chiefly commended for the curing and purging of this diſeaſe, of which ſhal be ſpoken hereafter in particular.

Chap. XII.

Of the proper remedies and antidotes and alexipharmaca of the Veneral Diſeaſe in general.

AFter the body is emptied in convenient manner, the greateſt hopes of this cure is in the proper antidotes of this diſeaſe, as from which only perfect health can be hoped for ſo indeed, that though divers other diſeaſes, ariſing from the corruption of humors, be often joined with this diſeaſe; yet if that malignity be taken away, a little while after either they vaniſh of their own accord, or are eaſily cured, but without the help of theſe remedies, no perfect cure can be hoped for by other medicines, under what name ſoever: and this too is obſerved by many that theſe kind of medicaments though by their manifeſt qualities they ſeem to be adverſaries to a hot and dry diſtemper, yet theſe hot and dry medicaments have been uſed with moſt happy ſucceſs by many who were endewed with a hot and dry diſtemper of the Liver, nay of the whol body, and who had a leane habit of body, nay were almoſt plainly conſumptive, from which very thing appeares, that in this diſeaſe, we ought rather to take care of the occult malignity, than of the manifeſt diſtemper. And therefore as ſoon as the body is in ſome ſort prepared and emptied, we muſt maturely haſten to thoſe Alexipharmaca of the Veneral diſeaſe.

Alexipharmaca of the Veneral diſeaſe are neceſſary.

But though ſome Phyſitians would advance and extol the vertues of thoſe medicaments which ſhal preſently be reckoned up, whiles they hold, that the decoction of Juniper wood, of the Olive tree, Box, Beech, and other trees may performe the ſame, as the decoction of Guajacum, ſo that a moſt ſlender courſe of dyet be uſed, as is wont to be obſerved with the decoction of Pock-wood: yet experience hath long ſince taught that that is falſe: for though it be certain that by a moſt ſlender diet ſome ſymptomes of this diſeaſe do grow more gentle, yet unleſs proper remedies be adminiſtred, a little while after the diſeaſe is ſeen to grow freſh again, and

returne

return more cruel: for such medicines indeed with a slender diet, may consume the vitious humors, but they cannot overcome the malignity: as therefore this disease is occult, and is not known but by its effects, so also the remedies which cure this disease, are not found out by reason, but only by experience.

What they are.

But what those medicaments are, Physitians again do not fully agree. Many put their greatest hopes in Quicksilver, and think that the only and proper Alexipharmacum of the Veneral disease; others do wholy reject it, of which business shal be spoke hereafter. Others, and most men indeed, undertake the cure of this disease with the use of Guajacum, Sarsaparilla, China root, Sassafras wood; and others doubt of these very things, nay some deny that this disease can be overcome by the use of Guajacum only and the like, and therefore they think their vertue ought to be quickned and increased by the mixture of other things. *Jul. Palmarius lib. de lue Vener. cap.* 13. distinguisheth and thinks that Guajacum is not of so great force that that alone can wholy extinguish the root, and al the deadlines of the veneral poyson; neither that it is so weak, that it can do nothing without the help and conjunction of other things; he writes indeed that by the use of that alone, the humors being consumed, al the symptomes of the disease wil at length be allaied, and wholly lie hid, but yet the virulent taint of the disease, which is already in the solid parts, is not overcome, and wholy extinguished in most people by that remedy; but that the deadliness of the latent poyson be wholy extinguisht, and that the return of the disease be prevented, he thinks other alexipharmaca ought to be administred, which opinion doubtless he received from his Master *Fernelius*, for he writes that he, as in *lib.* 1. *de. lue Vener. cap.* 7. did first dare to promise a perfect cure of the French Disease without the use of Quick-silver, and that he took care for the Composition of many Alexipharmaca at his House, which he gave against this poyson with Guajacum, and sometimes without it, and as he writes in the alleaged *Cap.* 7. two of these medicines which he found to be most excellent and efficacious, he by the addition of other medicines hath reduced into one, which hitherto never failed any man.

But whenas these medicaments are compounded of common Alexpharmaca not proper to this disease, we shal not propose them in the first place, but hereafter we shal speak somwhat of them. But in the first place, we shal treat of those things which most Physitians have hitherto used, and which long experience hath now confirmed to be alexipharmaca of this disease, by the use of which it hath been a long time observed, that not only the vitious humors have been emptied, and the symptomes destroyed; but the very roots of the disease have been pulled up, that it could no more returne. Of which sort are your pock-wood, sarsaparilla, China root, Sassafras-wood, of which we wil now speak.

Chap. *XIII.*

Of the Indian Wood, and Guajacum.

The Indian wood.

AND first of al we wil treat of the Indian wood, as being that which challengeth the cheife place amongst the remedies of this disease. For whenas this disease is reported to be endemious in the *Indies*, the chiefe remedy is also fetcht from thence, which they cal the Indian wood; but this sort of wood, as appeares by *Consalvus Oviedus* a noble Spaniard, who writes of things in the *Indies*, is two fold; the one which is commonly known, called Guajacum, the other which is called the holy wood. For though by many these two woods are taken for one and the same, yet the forementioned Author, doth distinguish them both by their marks and places, concerning which see *Fallopius de morb. Gal. cap.* 39. yet whenas both woods have the same force to overcome the French disease, (though it be reported that the holy wood be of greater force against articular diseases, and others, and the holy wood is now a days seldom brought over to us) we shal only speak of Guajacum.

Two fold. Guajacum.

The holy wood.

Amongſt other new Iſlands found out in former Ages, there is one alſo, which the Spaniards the diſcoverers have called by the name of *Hiſpaniola*: whenas the Veneral diſeaſe was reported to be indemious there, and the decoction of a certain wood is eſteemed there the only remedy of that diſeaſe, which at this day is called guajacum, & by the inhabitants is pronounced with gaping Huajacum. The Spaniards infected with the ſame diſeaſe, having found the ſame decoction to be helpful, did afterwards diſcover its vertue to others: the tree is reported to be leaved like aſh, the color of the wood within is blackiſh, the wood it ſelf is heavy and ponderous, it floates not in water, but ſinks; 'tis ful of rozin, and while it burnes, it ſends forth no ingrateful ſcent, its taſt is ſomewhat bitter, with a light accrimony, pricking the tongue.

The Choice of Guajacum.

There is ſome doubt amongſt phyſitians concerning the choice of it; ſome are of opinion, that which is whitiſh, is to be preferred before the reſt; whenas by how much the leſſer 'tis in years, by ſo much the whiter it is, but the older it is, by ſo much the blacker it is: but that which is older is dryer, and that which is yonger is more moiſt, and more abounding with juyce, and therefore more powerful. But indeed whenas there is a two fould humor in living things, the one primogenious, the ſubject of innate heate, or the implanted ſpirit, apt to take fire; the other alimentary, more watriſh, and leſs apt to be ſet on fire: the vertues of this wood, as alſo of other plants, are not to be judged from the alimentary and more watriſh humor, but from that implanted heat, and primogenious humidity; which whenas in 'its tender age, both in infants, and in plants, 'tis overwhelmed and obſcured by much moiſture, many actions in that age are infirm and weak, which afterwards that moiſture being ſomewhat waſted, and the heat become more vigorous, in progreſs of time they become more ſtrong, and this heat the cheif inſtrument of al actions is wont to conſiſt unchanged til it comes to its ful age, and heigth: and therefore though the ſame innate heat and radical moiſture be alwaies in Guajacum, on which its vertues do depend, yet becauſe in the yong and tender wood, that vertue is as it were over whelmed, and reſtrained by the abundance of moiſture, that wood which is the yonger is leſs efficacious, than that which is now of a ful confirmed growth: and therefore for the cure of this diſeaſe, we muſt not chuſe that wood which is yellowiſh, or that is of a box colour, or that which is cut of a tree not ful grown, or from the boughs, as being leſs efficacious; but rather that which is ſomewhat black, becauſe that is more roziny, and abounds with that fat and balſomy ſubſtance, in which doth chiefly reſide that vertue oppoſite to veneral virulency. It is good therefore to know the age of this wood, that we may chooſe the moſt effectual. For that indeed which hath the inward part black, and is long waies divided with clefts as it were with certain lines of a duskiſh colour, gathered into blackiſh rounds, that is efficacious, but yet 'tis ſuch as is cut off either from the arms of trees, or certainly hath not yet attained its ful maturity, and therefore 'tis of leſs efficacy: for thoſe kind of Lines do therefore appeare becauſe that fatty ſubſtance, which doth chiefly reſide in the middle trunk of the tree, is not yet ſo plentiful, as to fil up al the internal parts of the wood: but that which is black al over the internal parts, the ſuperficies only being whitiſh, that if it be ſound, weighty, and odorous, and prick the tongue with a light acrimony, and either is not divided with any lines, or elſe with thoſe ful of rozin, and therefore while it burnes beſides the grateful ſmel it ſends forth, it alſo yeelds a blackiſh rozin that hath attained the higheſt degree of maturity, and is cut off from the body of the tree, and is therfore moſt effectual, but if it be divided with lines, and ful of holes, and neither weighty, nor odorous, nor acrimonious, and being lighted yeelds no rozin, it is a ſign that that is now old, and therefore its vertues are grown dul.

How the age of this wood is to be diſcerned

L. Septalius alſo doth admoniſh us here, that there is a certain ſort of Guajacum, which is never to be brought into uſe, which hath no true blackneſs in the middle of it, but is of a ſomewhat darke and greeniſh colour, which makes the decoction very thick, that it wil never be cleare, and by its exceeding acrimony, it cauſeth a heat both

both in the throat and jaws, and by reaſon of its thick and earthy parts, for the moſt part it cauſeth obſtructions in the ſpleen, ſometimes alſo in the liver, Empiricks cal it the wild holy wood: but whereas he finds no where in Authors this twofould difference of domeſtick, and wild; he rather thinks it acquires theſe qualities from the nature of the ſoil.

Alſo if the barke be thick, and cleave ſo to the wood, that it can ſcarce be pulled and parted from it, the wood is good: but if the Bark be eaſily ſeparated from the wood, either 'tis old, or periſht by ſalt water: alſo if the wood appear fatty whiles it is raſped, and that being maſticated doth bite, and leave a bitterneſs behind it; and whiles it is cut, it appeare ſolid with an even ſuperficies, not rough and ful of holes, the wood is good.

The bark of Guajacum.

The Bark of this wood is endewed with great acrimony and bitterneſs, and therefore dries, attenuates, and digeſts more powerfully than the wood; but becauſe that occult vertue which is oppoſite to this diſeaſe, is rather in that fatty and moiſt, and balſamical ſubſtance, the wood is alwaies preferred before the bark; and beſides the bark is not ſo conveniently given in hot and dry bodies.

The vertues of Guajacum.

As concerning the vertues of Guajacum, it is hot and dry, as may be perceived from its taſt, ſmel, and acrimony, and that in the ſecond degree, and 'tis alſo of thin parts, whence it hath power to attenuate craſs things, to cut and cleanſe clammy humors, to open obſtructions, to move ſweat and urine, and to diſſipate and waſt ſuperfluous cold humors: but this pockwood is not chiefly given for thoſe qualities (whenas there are found in *Europe* medicaments endewed with thoſe qualities, that there was no need to tranſport them out of the *Indies*) but principally for that peculiar and occult power. By which it is oppoſed to the Veneral virulency: and truly al phyſitians almoſt doe agree that pockwood doth deſerve the firſt place amongſt the alexipharmaca of the veneral diſeaſe: for though *Fernelius* would ſomewhat leſſen its vertue, becauſe al that are affected with this diſeaſe are not cured by the uſe of it, yet this is no ſufficient cauſe, ſince there is found no ſuch alexipharmacum, or other medicine which can cure diſeaſes paſt hope. But this wood is by an occult quality and propriety oppoſite to the Veneral virulency it ſelf, and is a friend to the radical moiſture, and natural baſſom, which doth moſt of al ſuffer by this virulency inimicous to the nutritive faculty; and doth ſo ſtrengthen it, that it hath been obſerved, that thoſe alſo, who had a liver, and whol habit of body hot and dry, and who have been almoſt conſumed with the veneral diſeaſe, as was ſaid before, by the uſe of the decoction of this wood, though by its heat and dryneſs adverſe to them have been reſtored, and become better habited and more corpulent. Some indeed have dared to write, that the decoction of this wood doth nouriſh as much as chicken broath: but theſe ſeem to me, to be exceſſive in the praiſe of this wood: for though it be a vegetable, and perhaps may leave ſome alimental juyce in the decoction, yet I think no body that is in his right mind wil eaſily deny, that a chicken hath not more convenient nouriſhment for a man, than Guajacum, but that ſome after this diſeaſe become more corpulent, is accidental; for whenas by reaſon of the Veneral virulency nutrition was hurt in the whol body, when that is diſcuſſed and extinguiſht, the body begins again to be nouriſht wel, and to be augmented: the like of which happens alſo in ſome other diſeaſes, eſpecially in feavers, before which whenas men were not wel fleſht by reaſon of evil nouriſhment, the vitious humors being waiſted by the diſeaſe afterwards they begin to be nouriſht wel, and become more corpulent.

Whether pock-wood do nouriſh.

Fr. Arcæus alſo *lib. de curand. vulner. rat.* gives the † Decoction of Guajacum for ulcers of the Lungs, and the ptiſick; and he writes, that bodies, though they be waſted, are not offended by it, but rather grow fat upon it: nay there are ſome, who attribute a nutritive power to Guajacum, and write that it is no leſs nouriſhing than chicken broath. The ſame vertues alſo others do attribute,* to Sarſaparilla, Saſſafras, and eſpecially to China root, but indeed though it be found by experience, that in the

† *Whether the decoction of Guajacum, ſarſaparilla, ſaſſafras China root, do fatten.*

* *The decoction of Guajacum, Sarſa, Saſſafras, China root, nouriſh not but by accident.*

the ptisick, Veneral disease, scab and other diseases, bodies extenuated, have been restored again, and made fat by the use of these decoctions, yet this comes to pass not of it self, because these decoctions have a nutritive faculty, as other nourishments, but by accident, in as much as they take away the cause of leanness. In ptisick bodies the case is plain; for whenas that wasting of the body proceeds from an ulcer of the Lungs, the ulcer being dried up by the use of Guajacum, the body begins to be wel nourisht again: the same happens in other diseases, as the French, the Scab, and the like. For whenas that leanness, and consumption doth proceed from bad nourishment, but bad nourishment for the most part from acrid and salt humors, which do both consume the good blood, and hinder the agglutination of it to the body, those vitious humors being wasted by the decoctions, and discussed by sweats, the bodies begin to be nourisht wel again, nay grow fat.

But this wood hath not only an alterative power, and by its occult quality to extinguish that malignity of the Veneral virulency, imprinted both on the humors, and the solid parts, but also to evacuate, both sensibly by sweating, and insensibly by insensible transpiration: and therefore the way of curing the French disease by Guajacum, and medicines of affinity with that is most in use. For though by reason of the length of the cure, and the pains of sweating, and the slender dyet, it cause some trouble to them: yet it is far safer than that way, which is by quicksilver, where if there be an error, the patient is in no smal danger.

Medicines made out of Guajacum.

But there are prepared out of Guajacum divers medicaments, and those either in a liquid forme, or in a solid, and in substance: but those given in a liquid forme, are most effectual, whenas they are easily deduced into act and penetrate into the whol body, and do irritae the expulsive faculty of al parts to cast off what is hurtful: but in a solid forme, whenas that part in which the vertue of the medicine doth cheifly reside, is not yet separated from the earthy and thick part, 'tis not so easily deduced into act. The decoction therefore as most convenient is most in use: yet if any by reason of the continued use of this medicine be weary of it, and nevertheless do feare least there be some reliques of the evil humor remaining, or their course of life wil no longer admit of the use of the decoction as it ought to be taken, to such, medicines made out of this wood, may be given in another form. Amongst which extracts and spirits, as shal be said, are most efficacious, and far more excellent than pouders.

The manner of preparing a decoction of the wood.

But the manner of boyling this wood is various, both in respect of the liquor in which the decoction is made, and of the quality of the liquor: for some boyl the wood in water, some in Barly water, some in distilled waters, others in wine, others in Whey, and others in broth of Flesh. *L. Septalius lib. 7. adnimadversionum.* 204. reprehends those who deny, that the decoction of this wood may be made in wine only, when as nothing is more fit to extract the faculties of medicines, than wine, and the water of wine (he had spoke righter than the spirit of wine) and therefore he prepares his decoction with wine, which he useth when the disease is inveterate with an evil habit of body, and a cold matter predominant: after this manner eight ounces of the bark of the best holy wood grossely poudered being infused in forty two physical pints of the best white wine, for two days, the wine being first heated and alwaies kept hot those two days in a double vessel, or in the ashes; afterwards with a slow fire boyl it away in a double vessel, to the consumption of the third part, which let the sick make use of, both in the morning instead of a syrup, and for his drink at meales, let him take in the morning seven ounces, & an hour after move sweat: but at dinner, and supper let him not exceed fourteen ounces. But though we grant that wine is most commodious to extract the vertues of vegetables, yet this cannot be denied that by boyling the strength of wine doth vanish, and when the spirit is exhaled, there is left a nauseous phlegme less profitable than plain simple water. And therefore I am of that opinion that either the wood is to be boyled in water, and towards the end, the wine is to be added, or else the wood

Whether it ought to be boyled in Wine.

is

is only to be a long while infuſed in wine, or to be boyled in a double veſſel, that nothing be loſt, but by no means to the Conſumption of the third part.

Therefore moſt commonly and rightly the decoction is made in pure water, which doth both a little correct the Heat and drineſs of the Medicine, and further the diſtribution, and provocation of ſweat, yet if the body, and eſpecially the ſtomach be cold and weak, and the Patient accuſtomed to wine, Wine is not unprofitably mixt with it, as was ſaid even now, and ſhal be ſaid hereafter; for by the admiſtion of Wine the ſtomach is leſs hurt, and the vertue of the Medicine doth the eaſier penetrate to al the parts.

The proportion of wood to the water.

And a different proportion of the wood to the water is obſerved according to the age, conſtitution of the body, and ſeaſon of the year, and they take to twelve pound of water, from three ounces of the wood to twelve: for if the ſeaſon of the year and the body be hot, 'tis ſafeſt, to take a leſs quantity of the wood, and in a longer time to perfect the Cure, than by too ſtrong a Medicine to damnefie the patient, eſpecially at the beginning of the cure, and before the ſuperfluous Humors in the body be abated, and ſweat begin to flow eaſily and exquiſitly, and the patient be accuſtomed to the Decoction, afterwards by degrees you may take more of the Wood, which unleſs it be obſerved, the Patient is eaſily brought into danger. And *Euſtachius Rudius* writes, *Lib. 5. de Morb. occult. Cap.* 13. That he hath ſeen patients who by this error, *viz.* too great a quantity of the wood given on the firſt daies, have fallen into a Feaver, that afterwards they have been forced to abſtaine from the uſe of the decoction, to their great detriment: but where there is no ſuch thing to be feared, in thoſe of ripe years, we commonly add to one pound of the wood raſped or turned ſmal, twelve pound of water, in an earthen Veſſel glaſed, and let it infuſe twenty four hours in a warm place, afterwards the veſſel being wel covered boyle it with a gentle fire, til half, or the third part remain, and let the decoction cool in this veſſel ſtil covered, afterwards ſtrain it.

After what manner 'tis to be boyled.

Fallopius Lib. de morb Galli. cap. 46. diſputes whether it be better to boyle it with an open fire, or in a double veſſel as was ſaid, or in Balneo Mariæ, and reprehends them who hold that the decoction made in Balneo is more dilute, or leſs powerful: and that the decoction made in Balneo, is more excellent than that which is made with an open fire, he endeavors to prove by the example of diſtilled waters, which by the balneum are made moſt excellent, when as there is no aduſtion in them, but the greater eliquation which is made in that hot and moiſt, doth render the decoction more excellent; but experience teacheth otherwiſe, which reaſon alſo doth confirme. For though out of ſome moiſter plants, as Roſes, Violets, Lilly of the vallies, and the like, being freſh, whoſe vertue conſiſts in the volatile part, as the Chymiſts ſpeak, the beſt waters are made in balneo without the affuſion of water: yet in hotter plants, eſpecially in Roots and woods, whoſe vertue conſiſts in the oyly part, their vertue can never be extracted by the too gentle heat of a Balneum, as happens alſo in many ſeeds, but they muſt be diſtilled by a † Veſica through which by the vehicle of the water, thoſe more fixed parts may be elevated: when as then the whol vertue of Guajacum doth conſiſt in that oyly and rozeny part, and there is need of ſtrong boyling that that may be extracted, the gentle heat of a Bolneum cannot do it, but it muſt be boyled in an open fire, which nevertheleſs cauſeth no aduſtion, if there be added a ſufficient quantity of water.

A chymical Veſſel.

Some for the better guſt, and that the bitterneſs and acrimony may be abated, a little before 'tis boyled enough add of Raiſon and Liquoriſh, of each one ounce; and you may add Sugar, or ſome Julep to relliſh it, *Aurelius Minadous, de virulen. Vener. Cap.* 4. holds the Decoction ought chiefly to be Dulcorated with Honey;

Honey; for he thinks that a smal quantity of Honey, if it be boyled with it and Skimmed, wil rebate al the bitterness, and the Decoction acquire a greater power to cleanse, attenuate, open, and make fusil the Humors, and strengthen the parts: which we grant may take place in phlegmatick bodies, and especially in a cold stomach; so whenas honey doth easily turn to Choller, we think it cannot safely be used, in chollerick bodies, hot and dry, but more conveniently and safely Raisons, Liquorish, or Sugar.

Some also in those who have a hot and dry Liver, do add towards the end of the decoction a root or two of Succory, one or two handfuls of Endive, Sowthistle: but whenas such decoctions are to be continued along while, we must have a care least by the admistion of such things they be made ingrateful, and provoke nauseousnes in the Patient: besides whenas for the most part there is boyled at one time Decoction enough for many daies, but the addition of such Herbs doth cause, that the Decoction wil not last so long, to prevent this, such herbs are to be added not to the whol decoction, but to about one pound of it.

Some not unprofitably, especially to those accustomed to it, and whose stomach is weak, do add towards the end of the decoction three pound of a sweetish white wine; some prepare the whol decoction in wine, but not so rightly: for the best part of the wine doth evaporate in boyling, and there is left an ingrateful Flegm as was said before.

Aurelius Minadous, also doth admonish, that the decoction of the wood is to be given with a vehicle, which may direct the vertue of the Medicine to the parts principally affected; and the Head most of al affected we must mix Cephalick things; the Reins affected, things Nephritical; the Liver, Hepatical; the Spleen, things Splenitick. Which as we do not wholly disallow of, so we do not alwaies think it necessary, whenas the vertue of the decoction doth easily of it self penetrate into the whol body: but we must chiefly have a care, least by the admistion of such Medicines, the decoction be rendered nauseous and ingrateful to the Patient; which when he himself also considers, he admonisheth rightly, that such Medicines are more commodiously taken by themselves reduced into a pouder, or Bolus, or some other forme, than mixt with the decoction; but we shal speak hereafter of compound decoctions.

Distilled water from Guajaum. The Chymists whenas they fear least by the long boyling, which is to the half, or a third part, the Spirituous and subtile parts should exhale and be dissipated, and so the vertue of the Medicine be diminished, prepare this decoction another way, so that it loseth nothing of its strength, they take the pouder of Guajacum and put it into a retort, and pouring a sufficient quantity of water, they place the retort in the ashes, and apply the receiving vessel, and making a fire under it, first they make a digestion, then distil it, to the Consumption of one half of the water they give of the distilled water four ounces; yet it were most commodious if the distilled water were mixed with the rest of the decoction in the retort being strained; for so they would have al the vertue; to that decoction remaining in the retort may be poured more water, and let it digest twelve hours, afterwards distil it; and the liquor distilled may be given for common drink, and whenas it happens somtimes, that Infants are born infected with the Veneral disease, or are infected by their Nurses, this distilled and sweetned with Sugar may be given them instead of Juleps.

The second decoction. Also after that the first decoction prepared the common way, is strained, twelve or eighteen pound of water again is poured to the wood remaining after the first boyling according as the Patient is wont to drink more or less, and is boyled to the Consumption of the third part; and being strained is given for ordinary drink at dinner and supper, if they desire a more pleasant and sweeter drink, you may add four ounces or more of Raysons, or instead of Raysons, one ounce or

two

two of Coriander seed prepared, and sweeten the decoction with two or three ounces of Sugar.

But if any Herbs have been added to the first decoction, the decoction for drink at meals must not be made of the remainders of the first decoction because it would be nauseous, but you must prepare another fresh decoction, but more dilute, or a wine of Guajacum, which is made thus: Take four or five pound of the wood, four pound of white Sugar, ten pound of white Wine, and put the wood into a wooden Vessel, and heat the Wine and powr it to it. *Wine of Guajacum.*

Some boyl the wood the third time, and use the decoction to boyl meat in, the same decoction also may be used to wash the hands, to clense the Nostrils, and mundifie Ulcers. *The third decoction.*

And some give this wood other waies, some in the form of a pouder, others make electuaries of it. Thus *Nicol. Massa. Lib. 2. de Morb. Gal. Cap. 6.* he takes of the Indian wood most finely prepared one pound, and with Syrup of Fumitory boyles it to the form of an Electuary, of which he gives half an ounce or an ounce; or take of the wood of Guajacum, Sarsaparilla, finely poudered, of each one ounce, of the species of the three saunders and Diarrhodon Abbatis, of each two drams; Conserve of Succory, Roses, of each six ounces; with Syrup of Succory make an Electuary. *An Electuary of Guajacum.*

Others with a convenient Syrup make pills of it.

But others not without cause do here admonish us, that such Medicines are less effectual, and that many, who were newly infected, when as they hoped for health by the use of such Medicaments, by that delay and lingring and weakness of the Medicine have fallen into a most grievous evil: for as was said, such Medicines do less penetrate into the body. Yet towards the latter end of the Cure, when the evil is almost overcome, and 'tis only feared, that there may remain some evil disposition, and the long continued drinking of the decoction of the wood is nauseous to the patient, such Medicines may be used to consume the reliques of the disease.

An extract of this wood is more commodiously prepared, and out of that pills, or rowles: but after the use of it there is need of taking some liquor, by whose vehicle the extract may be distributed and carried into the whol body: nay these extracts, according to the opinion of *Hercules Saxonia*, have scarce so great strength as to overcome this disease if it be very great and ancient, but the decoction is deservedly preferred before them. *An extract of Guajacum.*

Hercules Saxonia de lue Vener. cap. 27. writes that the oyl is stronger, and he thinks the whol Alexipharmacal power of the wood is placed in this Oyl, and he relates that he hath proved by experience, that by the benefit of this oyl; the greatest and ancientest disease hath been overcome. But he gives it divers waies, in wasted bodies with milk, in others of a hotter temperament, with Conserve of Roses, or whey of Goats; in Melancholly with conserve of Burrage or Bugloss, in Flegmatick with Conserve of Betony, in those that have knobs with Turpentine, and two scruples for a dose. But doubtless it was not oyl which *Saxonia* gave, but a liquid extract or Tincture as they cal it. For no oyl is distilled from this wood by an Alembick: but that which is distilled by a retort, or descent by an open fire, is found to be such, that it cannot conveniently be given into the body, nay scarce with safety. *The oyl of Guajacum.*

I attribute more to the spirit of Guajacum, the preparation of which is not every bodies work, for it requires a longer and more diligent digestion and fermentation for the preparing of it. *The spirit of Guajacum.*

There are some also who think, the leaves and fruit of this tree being reduced into Conserves and Electuaries are to be used, and they relate, that the Indians infected with this disease, do use them as Medicines; but though the leaves and fruit may do somwhat in a light disease, yet they are not sufficient in that which is great

great and inveterate, neither are they able to perform what the wood doth. But 'tis obſerved that the fruit of this Tree hath alſo a power vehemently to looſen the Belly; and whenas a freſh and light diſeaſe is ſomtimes cured only with purges, 'tis no wonder that the Indians may be cured by theſe purging fruits; eſpecial ſince that al Alexipharmacal vertue againſt this diſeaſe cannot be denyed them.

CHAP. XIV.

Of Sarſaparilla.

Sarſaparilla. NExt to Guajacum, that Root challengeth the firſt place in curing the Veneral diſeaſe, which ſome call Spartam Parillam, ſome Salſam Parillam; the Spaniards Sarſam Parillam, by reaſon of the ſimilitude which it hath with the plant called rough bindweed. By reaſon of its thornes 'tis called Sarſa, (for Sarſa in Spaniſh ſignifies Bryers or Brambles) but by reaſon of its leaves, and boughs, Parilla, that is to ſay the thorny vine. Nay *Fallopius de Morb. Galli. Cap.* 63. is of that opinion, that it is truly the rough bindweed, which grows every where in *Italy*, and he writes that by the uſe of it, he hath with happy ſucceſs freed many from the French Pox. *Dioſcorides* alſo *Lib.* 4. *Cap.* 139. writes thus of the rough bindweed, its leaves and fruit being drank before, and after, are antidotes againſt deadly poyſons; and beſides 'tis delivered that if ſomwhat of them poudered be given to a new born infant to drink, no poyſon ſhal afterwards hurt it. But grant it be ſo, that the Italian rough bindweed can do ſomwhat againſt this diſeaſe, as alſo againſt other poyſons, yet he himſelf grants, that there is no light difference betwixt this and the Indian.

The native place of ſarſaparilla. But Sarſaparilla grows in *Peru*, in the hedges, as rough bindweed, the white and black Bryony, and hops do in Europe. The Root creeps far up and down by the Earth, that 'tis oftentimes above ſix cubits long, which gathered into bundles is brought over to us. The good and freſh is white, ſolid, but that which is reddiſh, and poudery when 'tis broke, is leſs effectual.

The vertue of it. Its vertue as I have ſaid is very great alſo in curing this diſeaſe, and 'tis found by experience, that many have been cured by the uſe of it, without Guajacum, and becauſe 'tis more Temperate; and moderatly hot, and without any acrimony, bitterneſs, or aſtriction, or ſmel, but hath a certain obſcure ſweetneſs, it may ſafely be given to al conſtitutions of body, and al Ages; beſides 'tis of thin parts, provokes ſweat, dries eminently, reſiſts putrefaction, waſts ſuperfluous humidity, ſomwhat looſneth the body, and therefore is wont in ſome ſort to weaken the ſtomach; but though Guajacum be more powerful and efficacious, yet Sarſa in this exceeds that wood, that it hath an eminent power to allay the French pains, though never ſo accute and ſtubborn, by reaſon of its exceeding tenuity, penetrating and laxative vertue: and *Jul. Palmarius* writes, that no pain can happen ſo contumacious and ſo continual, which at length it doth not lay aſleep and overcome, if any one uſe the decoction of it for a long time and conſtantly. Nay al knotty French Tumors ſo they be not bony, in what part ſoever they are, are Rooted out by the uſe of it, their matter being melted and caſt forth by ſweats, or at the leaſt waſted and emptyed by inſenſible perſpiration: and *Fallopius* writes in the alleaged place, that if after the diſeaſe is overcome there remain Ulcers, Clefts about the Arſehole, that Sarſaparilla will heal them ſooner by half than the Indian wood, and in a ſhort time alſo the moſt hard knobs are diſcuſſed by it. Yet ſome admoniſh here, that by Guajacum indeed this diſeaſe may be perfectly cured, and that al things are found in Guajacum, which are neceſſary for the cure of this diſeaſe, but that ſarſa doth not alone, but mixt with

Guajacum,

Guajacum, China Root, and Sassafras wood cure this disease, and for this reason, because it loosnes the stomach, heats les, is void of al acrimony, and therefore is not so absterssive, and being inodorous, hath not the power to refresh the spirits. But these accusations fetcht from the manifest qualities, seem not to be sufficient; truly that Guajacum doth challenge the first place in this disease, is not to be denied, in the interim it hath been observed also by many, that somtimes this disease hath been cured by the use of this Root only; and if perhaps it do to much sax the stomach, that may easily be prevented.

The manner of giving it.

But this also is given divers waies, for the most part as Guajacum in the decoction concerning which we must note, they that wil not spare for cost and desire the decoction should be more effectual, they ought to take only the bark, as which is the more effectual part of the Root, and to cast away the inner piths as that which is les effectual, nay as 'tis delivered by some 'tis more cold, and hath a certain astrictive faculty.

The decoction.

But the Root of Sarsaparilla is taken being sliced thin and to one ounce of it is poured two pound of water, or to two ounces and an half of the Root four pound of Water; some pour to four ounces of the Root seven pound of Water, others to three ounces; ten pound of water. Neither can the quantity of the water to the Root be so strictly prescribed, but it may be varied according to the Nature of the disease, and the condition of the sick, and the season of the year. For in an inveterate disease there is need of a stronger decoction, in a new, of a weaker. But it is steeped first of al fifteen hours or twenty, and afterwards boyled to the Consumption of one half; and reasons, liquorish and other things are added to the decoction, as need requires as in the decoction of Guajacum; and because the decoction of Sarsa doth somwhat lax the stomach, for the most part mint, Betony, or somwhat else that strengthens the stomach is to be added, or what seems more commodious, Guajacum, or least the mixture of divers things may breed nauseousnes after the taking of the decoction of Sarsaparilla, they must take somwhat that strengthens the stomach.

The second decoction.

After the first decoction is prepared, fifteen pound of water are poured again to the remainders, and are boyled til a third is wasted, and the decoction is used at dinner and Supper; some also add towards the end of the decoction three pound of Wine; yet this must be done then only as *Fallopius* thinks, either when the sick body goes abroad, to preserve his strength, or when the stomach is weak.

Yet there may also be prepared out of this Root, pouders, Electuaries, extracts, as are from Guajacum.

CHAP. XV.

Of China Root.

China root.

THe Portugal Merchants brought over in the former Age, from the Country of China, a certain Root for the cure of this disease, which they called China Root; for when as the Venereal disease had invaded that Country also, as the Americans shewed the use of Guajacum for the destroying of this disease, so the people of China used this Root to cure the same disease, and taught others the use of it. But the Root is a handbreadth long, somtimes pretty thick, somtimes thinner, knobbed, somwhat reddish, pretty weighty, which being newly digged up they report is so tender, that it may be eaten raw, and boyled, as turnep and rape Roots are with us; the which seems not to be very credible, whenas our Turneps, Rape Roots dryed never attain to so great a hardnes: they are brought to us divided.

As concerning its vertues, 'tis neither ſtrong in ſmel, nor taſt, and therefore there is no exceſs of it in heat and cold, but 'tis rather temperate, or if there be any exceſs in it, 'tis rather in cold; yet 'tis dry in the ſecond, of thin ſubſtance, yet with a certain aſtrictive power, and a kind of ſubſtantifical moiſture, ſo that by the uſe of it men do grow Fat. Whence alſo the decoction of it doth eaſily ſowr. When it was firſt brought over by the Portugals into France and the neighbouring provinces, it was wonderfully cryed up by the Merchants, as being of thin parts, and having power to digeſt, to more urine and ſwear, to conſum Excrements of al ſorts, to cleanſe the Bowels, free from obſtructions, clear the blood from corruprion, to take away pains in the Joynts, to be good for the Venereal diſeaſe, and becauſe 'tis temperate, it may ſafely be given to any age, ſex; any time of the year, and to thoſe that are feaveriſh; al which faculties whenas they are not in Guajacum, by ſome of that time it was made uſe of not only for the cure of other diſeaſes, but alſo for the cure of the pox it was preferred before Guajacum. Which very thing cauſed that *Charles* the fifth Emperour, being ſick of a moſt grievous Gout, was the firſt almoſt that would make tryal of the uſe of this Root, upon the advice of ſome Phyſitians. But experience afterwards leſſened that fame; and *Jul. Palmarius* writes of this buſineſs *de lue Vener. Cap.* 14. that many to their great detriment have preferred this root before Guajacum, and that he hath found by experience, that alſo in a very ſtrict diet it hath been uneffectual againſt this diſeaſe, oftentimes alſo the ſtomach is ſeen to become ſo moiſt with the uſe of its decoction, and the Native heat oppreſt, that a great Lientery, and crudity hath often followed in thoſe who had but weak Fuell for their implanted heat. Beſides theſe diſcommodities and faults, he writes alſo that it doth oftentimes cauſe ſwelling of the Spleen and hardneſs, in thoſe that uſe it long; neither doth he grant it to have extraordinary vertue againſt this diſeaſe either by its whol ſubſtance or occult quality, when as after the uſe of it, they who thought themſelves wel, do dayly fal into a relapſe of the ſame Diſeaſe. The ſame alſo is confirmed by *Gabriel Fallopius Lib. de Morb. Galli. Cap.* 60. who writes that he hath uſed this Root again and again, for the Cure of this Diſeaſe, but could do nothing with it, in the interim he writes that he hath uſed it with happy ſucceſs for the dropſie, to moderate the mobility of the Humors in hot bleared Eyes, and in a hot diſtemper of the ſtomach and Liver. And other Phyſitians alſo agree in this, that this Root for the Cure of the French Pox is far in feriour to Guajacum and Sarſaparilla, although it be profitable to preſerve and ſtrengthen the heat of our body, and therefore for other diſeaſes. And if by chance any one, who could not be cured neither by the decoction of Guajacum nor by the unction of Quick-ſilver, hath recovered health by the Decoction of China *Jul. Palmarius* thinks this is the Cauſe of it, becauſe Nature rejoycing in the Variety of Remedies and weary of the ſtronger, at length is eaſied by thoſe that are leſs effectual. Yet *Garzias ab Horto*, relates of the Root being freſh, that it doth ſo exceedingly heat, that if any one uſe the pure Decoction of it, or drink it hot, by reaſon of the too great heat of the Medicine he wil fal into exceeding heats of the liver, Eryſipilaes, and Phlegmons, and other moſt grievous Symptoms. But when as 'tis brought over to us inſipid and ſomtimes duſty, there is no cauſe to fear any ſuch thing. Neither doth this only happen in this plant, but alſo in many others, that the Alimental juyce hath far othet vertues, then the dryed Plants: and therefore though perhaps this Root being freſh in China may have great vertue to Cure the Venereal Diſeaſe, yet it is not neceſſary, that it retain the ſame with us.

The decoction of China.

But divers prepare the decoction of this root diverſly, *Jul. Palmarius* writes that the common way of preparing it is this, that to two ounces of the root, cut into rounds, and put in an earthen pot, there is poured four pound of water and let them ſteep twelve houres, afterwards boyl with a gentle fire to the conſumption of the

the one half. *Fallopius* boyles two ounces of the root in twelve pound of water, to the consumption of half, but according to the nature of the disease the proportion of the root and water may be varied: and the root may be boylled from one to three in twelve pound of water. Yet *Septalius* adviseth us here, that this decoction is most commodiously prepared, if one ounce of the root fresh and not rotten be boyled in ten pound of water, & two ounces in twelve pound of water. For he writes, though many physitians, to save charges, whenas many cannot take al that decoction in one day, and they feare if they should keep it another day it would grow sowre, do boyl half the portion of China in half the quantity of water, and boyl away the half, or two thirds, thinking that so they have both saved their purse, and prepared the decoction as strong, yet they are very much deceived, and if they have not lost their taste, they shal easily know, that that first decoction is much more powerful, than the second, and the reason is ready, because 'tis not enough to give a proportion of the root to the water, but the time of boyling is cheifly to be considered, and the action of the heat of the fire, and the reaction of the water. For whenas, foure houres space, imagine, ought to be allowed, to extract the vertue out of a most hard root, and communicate it to the water: how much time wil be spent in boyling away six or eight pints of water, if taking but the half quantity, viz. half an ounce of China with six pints of water, we suffer the half to wast or two thirds, which wil be consumed in less than two houres space, the water being less able to resist the action of the fire? nor let any one dare to say that we may prevent this inconveniency, by making a less quantity of fire, and if it he boyled by a slower fire for to extract this vertue out of a more solid substance, there ought also to concur a due quantity of fire.

Out of the remainders another drink is prepared by some for dinner and supper, as out of Guajacum. Yet *Palmarius* thinks that al the vertue of that root is transfused in the liquor at the first boyling, and therefore for ordinary drink he boyles three ounces more of the root in eight pound of water til two pints are consumed and he ads raisons and liquarish, nay some also drink the first decoction, at dinner and supper, whenas it is not unpleasant to the tast. *The Second decoction.*

Some also do admonish us, that we provide no more of the decoction at once than may be spent in one day, whenas it quickly growes sour when 'tis cold, therefore they command also that it be kept on warm ashes: but experience hath taught us that it wil last four dayes. Yet because it growes sour, that very thing tels us that this root hath in it, somewhat spirituous and alimental, which is the cause of fermentation, and hence of acidity.

Consult concerning this with *Amatus Lusitanus centur.* 1. *curat.* 98. and especially *centur.* 2. *curat.* 31.

CHAP. XVI.

Of Sassafras wood.

THey use also for the cure of the Veneral disease that wood which is connonly called sassafras, which is imported form the Island called *Florida*: it is of an aromatical taste like fennel: 'tis hot and dry in the second degree, of a thin substance and endewed with an opening, discussive, and attenuating faculty; and therefore is commended by them who have sailed to the Indies, against long tertian feavers, evil habit of the body, and dropsie, and to strengthen the stomach, and against nephritical paines, it is comended also for the gout, to move the courses, and many other diseases, to treat of which is not proper to this place; 'tis used also for the cure of the French pox, yet most physitians agree that 'tis less effectual than Guajacum and sarsaparilla, and the decoction of it is prepared almost as that of Sarsaparilla. *Sassafras-Wood.* *Its vertues.*

Chap. XVII.

Of Sope-wort,

Soapwort. Last of al sopewort is commended by some physitians for the cure of this disease which is bitter, acrid, and endewed with an abstersive and opening faculty, and is praised for the French pox and contumacious paines, which cannot be over come by other remedies. 'Tis reported to be the invention of *Zapata* a spanniſh Empirick: tis used both in the decoction, and in substance, the decoction is prepared after this manner.

Its decoction. Take *of green sopewort two handfuls, infuse them al night in eight pound of water, than boyl it til the sopewort is boyled enough, then strain one pound of it with half a pound of water and the herbs now boyled; and squeez them, and reserve it for a mornings draught to provoke sweat; taking seven or eight ounces. But that which remains sweeten with raisons or sugar for drink at meales, in summer and Cholerick bodies you may add one handful of Sowthistle or basterd Navelwort.*

But tis a remedy unpleasing to the taſt, *Eustachius Rudius* takes of soap-wort six pugils or more, and infuseth it in twelve pound of water, and boyles it to the consumption of half. But as *Septallius* hath observed, tis too great a quantity of water to so smal a portion of soap-wort.

The pouder. But the Root Cheifly is used in substance, and *Rudius* doth very much commend it in ancient french pains, and out of it he prepares this pouder.

Take *of ground pine two ounces; of white dittander one ounce and half; of Zedoary six drams: of the root of soapwort three drams: of pearl prepared half a dram.*

Make a pouder for 9. doses, but who can take for one dose almost four drams of pouder? and the other medicines do far exceed the soapwort, which notwithstanding ought to be the basis.

CHAP. XVIII.

Of Compound Alexipharmaca.

Compouond Alexiphbrmaca in the Veneral disease. But though al the medicines hitherto reckoned up, are good to destroy this disease, yet some are more effectual then others, and besides some have other qualities, for the which they are useful sometimes for this, sometimes for that end, as was said of the simples: and therefore seldom one of these medicines is used, but for the most part, many of them together. Indeed if the disease be simple, and none of the bowels be affected, nor there is no eminent distemper in any part, which may hinder the use of Guajacum, that wood is the most excellent of al, because it resists this disease both by its occult and manifest qualities: but if any disease be joyned with it, tis oftentimes most proficable to add sarsaparilla and China and there are added by some manny altering medicines, of which whenas we spake before, in this place we shal add nothing of them, but this, that we must have a care least by the mixture of Succories and endives and cooling medicines which are added to moderate the heat of Guajacum which yet is not so much to be feared, they hinder sweating which is only to be desired, and which brings more benefit, then a little heating can do dammage: next of al least by the admixtion of other things the drink be made ungrateful and nauteous, therefore passing by these that we may speake somewhat of the mixture of alexipharmaca, if the nature of the patient be very hot and dry, and

the

the humors violently fal from the head on the lungs, breast or other parts, Guajacum wood is not commodiously given alone, whenas it doth farther heat and dry the parts, and by its heat make the humors run and move, but then sarsaparilla is safer, and China more comodious, which doth at once moderate the heat, and hath an astrictive power, by which it stops defluxions: on the contrary if the strength be feeble, and there be a weaknes of the sight, sarsa is not commodious, whenas it loosens the stomach, and duls the sight, if there be a great consumption (if so be it hath not its original from the Venereal disease, for then this disease being taken away as the cause, that wasting also ceaseth, and the body begins to be nourisht better) Guajacum and sarsaparilla are not safe, But then china is far more profitable, as that which moistens substantifically, as they speak. Yet *Ludiciptalius* commends Sasaparilla above al the rest against a consumption, *lib.* 7. *animadv. num.* 214. as shal be said also hereafter in the last chapter. So if cruel paines molest the patient, or gummous tumors, or exceeding ulcers be joyned with them, Sasaparilla is most profitable, which doth discusse the french knobs, and easier appease the pains, then Guajacum. Thus according to the constitution of the Patients, and the Nature of the Diseases joyned with it, 'tis good sometimes to use Guajacum alone, sometimes Sarsaparilla, sometimes China Root, and sometimes to mix al of them, in a greater or lesser quantity, and sometimes the bark of Guajacum is added, sometimes three or four ounces weight to one pound of the wood, and they are boyled in fifteen pound of water. For examples sake.

Take *Of the wood of Guajacum half a pound; of the bark of the same, of sarsaparilla each three ounces: of China root one ounce and half. Infuse them twenty four houres in twelve pound of water, afterwards let them be boyled to the consumption of half, for a sweating drink. Poure on the remainder twelve pound of water, let them stand and infuse eight houres, afterwards boyl them to a consumption of a third part, for drink at meales.* Or.

Take *of the Wood of Guajacum one pound; the bark of the same, Sarsaparilla of each thre ounces. Boyl them in sixteen pound of water, to the consumption of half.* Or.

Take *of the wood of Guajacum, China root each one ounce an half, Sarsaparilla one ounce; infuse them twenty four hours in six pound of water, afterwards boyl half away. Poure on the residue ten pound of water, boyl it to the consumption of three pound: Strain it and give it for drink at meales.* Or,

Take *of wood of Guajacum eight ounces; of the bark of the same four ounces; sarsaparilla, sassafras wood each two ounces. Boyl them in twelve pound of water to the consumption of two thirds that there remains four pound, towards the end ad four pound of wine. Poure to the remainder sixteen pound of water: boyl it to the consumption of half, & towards the end ad four pound of wine, make a drink for meales.*

Whether purgers ought to be mixt with the decotion.

In this place we must not omit a question, concerning the use of purgers, whiles the decoction is drank to wit whether they ought to be mixt with the decoction or to be used at the same time with the decoction. For some do wholy reject them, and hold that purgers are neither to be mixed with the decoction, nor to be used apart, for this reason, because the bodies are wont diligently to be purged before they come to the use of these decoctions; next of al because purgers and sweaters do cause contrary motions. Others on the contrary do mix purgers with these decoctions, that by benefit of them the blood may be purified, and the belly constantly kept loose: others do not mix purgers with these decoctions, but purge at certain intervals, every eighth or tenth day, or at a longer distance, as need requires. which last opinion seemes to me to be treweſt. For though the body be purged before the use of these decoctions, yet some may easily remain, and ever and anon be collected, and sweating doth purge onely the thinner humors, but leaves the thick, neither after this manner are there caused contrary motions; for that day, that purging is ordered sweaters are not administred; but if purgers were mixed with the sweaters then there would be contrary motions. And besides by the admistion of purgers, the decoction being to be used so many weeks it would become nauseous and ingratful.

Hercules

Whether purgers may serve instead of sweaters.

Hercules Saxonia also holds *de lue Vener. Cap.* 38. That purging may be ordered every day, to wit in those, in whom sweat cannot, or ought not to be caused: he thinks sweat cannot be provoked in them, who either are of such a hard and thick Skin, that they can by no means sweat, or in those who fal into fainting and swouning fits, as soon as sweaters are administred: but he thinks they ought not to sweat, in whom the Veneral disease possesseth not the Joynts, nor the Skin, nor the superficies of the body, but hath rather taken up its seat about the bowels; but this opinion seems not to me to be agreeable to truth: for whereas he thinks, that some ought to have purgers administred because they cannot sweat by reason of the thickness of their Skin, or because they presently fal into swouning fits, is agreeable neither to reason, nor experience: for scarce any one hath so thick a Skin, that the pores wil no way open for sweat, and though on the first daies sweat doth not presently follow, yet after that the Humors are attenuated by the use of the decoctions, the passages and pores are opened, then sweat succeeds; especially if those Laconick Baths be applied as shal be said hereafter. And the Patient may so moderate his sweating, that he need not fal into fainting or swouning fits: and they that cannot endure sweating, wil not easily endure purging. Last of al purgers cannot performe the same, as those sweaters do. But that in some bodies sweaters are not to be administred, is falf: for though the disease may have its principal seat about the Liver and bowels, yet it cannot be, but also vitious Humors do abound in the whol body, whenas the Liver infected with this disease doth generate virulent blood, and distribute it to the whol Body.

Chap. XIX.

Of the manner of using these Medicines.

The manner of using these Medicines.

AS concerning the manner of using these Medicaments, first of al the decoction of Guajacum is administred, for the most part in the morning, and afternoon two hours before Supper. In the morning 'tis given from five ounces to eight or nine ounces before the evening, from three ounces to six ounces; the pouder is given to two drams, the extract to two scruples. Yet sometimes the evening drauft is omitted, especially at the begining, before the patient is accustomed to the Decoction. For what was said above of moderating the quality of the decoction, that also is to be observed concerning the quantity of the Decoction to be given, that the sick be not offended and overcharged which too much of it; which unless it be observed, it happens sometimes, that the sick fal into Feavers, contract Crudities, and there is caused a loosness, ill habit of body, and a Dropsie.

The dose of the decoction.

After the same manner we must give the Decoction of Sarsaparilla, China Root, and the compound decoctions. For though some do prescribe here divers doses, yet he shal not erre, that shal administer them in the aforesaid manner.

Sweat.

And indeed after the mornings drauft, we must endeavor that the Patient sweat; for experience teacheth, that they that sweat not upon the taking of these Medicaments, are scarce clearly freed from this Disease: but that sweat may flow the easier, let the Patient sleep one hour after he hath taken the Medicine, for so the Medicine is deduced into act. As for the time of sweating, first of al it is sufficient, if the patient sweat one hour, afterwards by degrees let him rise to more. But the manner of sweating is various; most do suffer their Patients to sweat in bed, which that they may do the easier bottles ful of warm water, or hot brick wrapt up in Cloaths, must be placed under the Arm-pits and sides of the Patient. Some provide a wooden Mantle such a one as *Andreas Tenzelius*, hath discribed and set forth in *Exegef. Chymiatr.*; which manner of sweating is not a little troublesome. But not without cause most men do prefer before al kinds of sweating in this disease, that which is

The time of sweating.

in

in a bath or sweating place as that which brings less trouble to the sick, when as weak Patients sweating in their bed, may use a Bath and a sweating place, and the heat of the bath may be made more intense or remiss at pleasure, be made dry or moist as the condition of the sick requires: yet a moist bath, and gently heated by the Vapor of hot water is most commodious; whenas that hot vapor of the Water, doth open and Lax the pores of the Skin, that the sweat flows the easier, and without any trouble to the sick: but dry baths are altogether laborious, and ought not to be used in dry and Melancholy bodies.

Baths twofold.

But those sweating baths are twofold, first of al those gaeat ones in which a body may walk, such as are our baths so commonly called in which many at once may sweat and be washed; such though they be used for the cure of this disease by Barbers in Italy, yet they ought to be eschewed, whenas if one that is lightly infected, receive that which exhales from another grievously infected, he may be infected more, and 'tis more commodious that every sick body sweat by himself. Then there are baths or smal sweating places in which one alone closed up may sweat: such are made of bords of wood Joyned together, which again are twofold, some which can receive a man upright. Without bowing of his body; *Jul. Palmarius* discribes it *de lue Vener. Cap.* 17. of a Square figure, seven Foot high, and four foot long and broad, whose description you may see there. With us others are in use made up of boards mutually receiving and received by one another, square, but oblong of that bredth, that a man may without any impediment set and extend his Arms, but two stories high, one where the Patient sets, so high, that as he sets he may put forth his Head, through a hole of the bords strictly fitted for the neck, but the lower part is of that depth, that if the Patient setting stretch forth his Feet, he cannot reach the lowest board: and it hath a little door, through which the sick may go into it, and a window behind, which may be opened upon neceffity: and it hath another little door towards the feet, through which an Iron or brass Vessel is put in ful of stones or refuse Iron red hot; and a Pipe in the upper part of it over against the Vessel, through which either plain hot water, or some convenient decoction is poured on the stones or dross by degrees, as much as the Patient can endure, from whence the Vapor exhaling diffused al through the body doth provoke sweat: and though after this manner the head be thrust forth, yet that doth no hurt, neither is it unprofitable, even where the head is affected; for though it stands forth, yet that sweats plentifully enough: in the interim the Patient doth not attract again by drawing in his breath those filthy Vapors which do Evaporate from his body, but the free and pure ayre by which he is refresht, that he doth more easily and happily endure sweating. But in what bath soever sweat is provoked, after the sweating is over the bath ought to be opened, that those filthy Vapors may be blown away and discussed by the free Air.

When we must sweat.

The most convenient time for sweating is the morning, yet somtimes we may sweat after noone, in which case the strength of the Patient is to be considered for there are some who wil easily endure sweating twice a day, other who but once, others who are not able to endure sweating once every day. But the Medicines which moue sweat must be taken upon an empty stomach, and an hour or two after the taking of the Medicine sweat must be urged.

How long.

But we must sweat so long as the strength of the Patient wil bear it, and if the patient sweat in a bath, or sweating place, and is not able to endure any longer the heat of the bath, he must be laid in his bed, in which afterwards sweat wil flow of its own accord, and without any loss of strength; the sweat must afterwards be wiped of, and after sweating the cold ayre must in no wise be admitted.

How often.

But how often we must swear, and how long the use of these Medicines is to be continued, cannot be defined in general. They commonly teach that these decoctions are to be continued for forty daies, yet somtimes twenty five daies or thirty do suffice: and somtimes in a more grievous Disease we must persist in the use of

these

these Medicines til sixty daies and more. For we must sweat so often and so long, til the Malignity of the Disease is overcome, and the vitious and virulent Humors are discussed by sweating, and al the Symptomes cease, especially the running of the Reins and Callous skars. For as long as these last. We must remain in the use of these Medicines. Nay though al the Symptomes do vanish, yet it is good so to continue the Medicines for some daies, that also the Maligne dispositions of the parts may be taken away, that there be no fear of a relapse.

But after noon, though sweat be not moved, yet the same decoction given then, may insensibly discusse the vitious Humors, and destroy the virulent disposition impress both on the parts and Humors.

CHAP. XX.

Of other common Alexipharmaca.

Common Alexipharmaca.

BUt some trust not to those Alexipharmaca alone, as Guajacum, Sarsaparilla, China Root, and Sassafras wood, but add also common Alexipharmaca. This was first done by *Fernelius*, who gave to those that were to drink the decoction, half a dram or one dram of this Opiate, or Alexipharmacal antidote, which is prepared thus.

Fernelius, his antidote. Take *of the Leaves of water Germander, half an ounce; Poley of the mount. Penny royal, white Hore-hound, Origanum, Calamint, St. Johns-wort, centory the less; French Lavender, ground pine, Germander, Spikenard, of each two drams; of the Seeds of Anise, Fennel, Parsly, wild carrot, Libistick, Rue, Basile, Clary, Cresses, of the Berries of Bay, Juniper, of the Seeds of Male Piony, of each half a dram; of the Roots of round Birth-wort, Gentian, Dittander, Valerian, Asarabaccha, of each one dram; of Nut-megs, Cloves, Pepper, Saffron, of each four scruples; of Cinamone, Myrrh, Castor, Styrax Calamite, of each three drams; of good Honey as much as is Sufficient, make an Opiate.*

Jul. Palmarius, Fernelius his Scholer followed him, who, as was said before in *Lib.* 1. *de lue Vener. Cap.* 7. writes, that *Fernelius*, was most averse from the use of Quick-silver, and first dared to promise the Cure of this Disease without the help of that, and did take care for the compounding of many Alexipharmaca at his House, which he administred against the Mischeif of this Disease, with Guajacum and also without it, two of the which, which he found to be most excellent and efficatious, he describes, the first was discribed even now, the other is this.

Take *of Divils-bit, Scabious, Burnet, flowers of Marigold, Mullein, Plantane, Balme, Rue, Broom, Origanum, Rosemary flowers, Red Roses, of each three drams; of the Seeds of Citron, Sorrel, Fennel, blessed Thistle, of the Roots of Dittander, Gilliflowers, Tormentil, round Birthwort, Gentian, Zedoary, Roman Woolfesbane, of each two drams; Hartshorn, shavings of Ivory, Wood of Aloes, Yellow Saunders, Choice Cinamome, of each half an ounce; Saffron, Cloves, Nutmeg, of each two drams.*

And he relates that he called the first composition, the greatet Opiate, the other the less, and that he gave for a dose half a dram of either with the like quantity of conserve of Bugloss and half a scruple of Mithridate, and somtime without Mithridate; bnt that he, after *Fernelius* departed this life, out of them both did compleat one, adding also certain other Medicines, which he found to be prevalent against poysons, and most fit to provoke sweat, the description of which is this.

Take

Take *of water germander half an ounce; of divels-bit, scabious, burnet, Poley Mount, peneroyal, calamint, white sweet smelling Horehound, origanum, mint, St. Johns-wort, centory the less, French Lavender, Germander, Ground Pine, Plantane, Balme, rue, Time, Elder, each two drams; of Hyssop, the lesser Sage, Oake Ferne, vervin, both speedwels each two drams; Flowers of Betony, Marigould, Mullen, Broome, Rosemary, Jasmin, Sage, Red Roses, St. Johns wort, Bugloss, Burrage, Violets, Water Lilies of each three drams; Seeds of Anis, both Parsleys, wild Carot, Scarlet Graines, St Johns Wort, Libistick, Rue, Lovage, Basil, Berries of Bay, Juniper, seeds of both Pionies, Hartwort of each on dram and half; Seeds of citron, Sorel, Blessed Thistle, Fennel, of each three drams; of the roots of male Piony, Round Birthwort, Gentian, Sweet cane, Flowerdeluce of Florence, Sweet Cyprus, each one dram; of Angelico, Dittander, Gilliflowers, tormentil, Zedoary, Romane Woolfesbane, of each three drams and an half; of choice perle three drams and hal; of Harts horn, Shavings of Ivory each one ounce; wood of aloes, yellow saunders, bone of the heart of a hart, both currals each half an ounce; choice cinamon one dram and half; Balsome wood, if it may be had one ounce; of al pretious stones, each half a dram; of Nutmeg, mace, loves, myrrh, styrax, Calamite, Benjamin, Saffron, Castor, each half a dram; juice of liquorish one ounce; oyl of the seeds of Fennel, Anise, of Sage, mint, juniper, Nutmeg, Cloves, red opobalsamum brought out of America if it be to be had of each one dram.* Galmarius.

Let al the the herbs, flowers, and rootes be gathered at that time they are of greatest strength, let them be dryed, and kept in paper cases, then al of them being reduced into a most fine pouder, let them be mixt with wine and honey, and be boyled into an electuary, til it comes to the thickness of wel prepared mithridate: yet the flowers may be candied and kept with sugar, that they may be mixt with the other things towards the end of their boyling, to one pound of honey mix two ounces of the pouder. Let it be kept in a most large earthen vessel, whose third part may be empry, least it swel up, and grow hot, neither let it come to that use we shal by and by speake of, before it be three years old. He ads there also a cordial water, and an alexipharmacal pouder, their discriptions are these; the Cordial water.

Take *Of the leaves of sage, mint, marioram, rue, hyssop, origanum, the tops of betony each one handful. Bruise them al and put them in a great earthen vessel in a warm place and cover them with the water of blessed thistle, that they be under water. it, every day stir them with a stick, and before they soure, (which wil be the fourth or fifth day after) Strein out the liquor and keep it, casting away the Fæces. Again.* Galmarius his Cordiol water.

Take *of plantane leaves, marigold, balme, mullein, St. Johnswort centory the less, burnet, each two handfuls. After they have been steeped four dayes and streined cast them away, and take again of water germander, Bivels-bit, fennel, parsly, bugloss, burage, angelico of each one handful. Which also being steeped, so many dayes streined and then cast away.*

Take *of the roots of angelico, dittander, tormentil, betony, Zedoary, each half an ounce; of galangal, three drams; Nutmegs, Cloves, each one dram; seeds of Fenel, Citron, Sorrel, Blessed thistle, Juniper berries each two drams; Shavings of Ivory, harts horn, wood of aloes, Yellow Saunders, cinamon each one dram; Safforn half a dram; make a pouder of it and mixe it with the Liquor streined, then weigh out of the amulet against this disease, and of choice mithridate each one pound and half; of old treacle foure drams; and being mixt with the said liquor and pouder, and put up in a glass alembick, or an earthen one glazed, expose them six or eight dayes to the heat of* June, *til they grow hot, and be perfectly fermented, and at length distil them in a double vessel with a most gentle fire. If the same simples be put into a new pot with the water of bastard saffron and be heated fifteen dayes in warm horse-dung, there wil be extracted a more excellent Water.*

Take *of the aforesaid water three ounces*; *Syrup of* Lemmons *and Violets, of each six drams*; *Make a dose.*

A Description of the Pouder.

Palmarius his Alexipharmacal Pouder. Take *of the shavings of Ivory, the younger Harts-horn, Choice Pearles of each half a dram*; *wood of Aloes, Yellow Saunders, the bone of the heart of a Hart, of each one scruple*; *Seeds of Fennel, Coriander prepared, of each one dram*; *the Leaves of Mint, Plantane, Vervin, Burnet, of each two scruples*; *the Roots of Tormentil, Betony, Zedoary, of each half a dram*; *the dryed flowers of* Betony, *Marigold, Broom, of each half a dram*; *Sugar of Roses three times as much. Make a fine Pouder.*

The dose is one spoonful beforemeat, and before a drauft of the sweating drink, if the Patient refuse the use of the Opiate.

And in *cap.* 13. *Lib. de lue Vener.* where he disputes, whether this Disease may be perfectly cured by the use of Guajacum alone, or whether there be need of the assistance of other Medicines joyned with it, at last he concludes with a distinction, that the vertue of Guajacum is neither so great, that that alone can wholly Extirpate, the Roots and whol malice of the Venereal poyson, nor so weak, that it can perform nothing without the help of others; that by the use of that only, the Humors be wasted, al Symptomes wil at length be allaied, and wholly lie hid, but yet the taint of the disease, which hath already taken possession of the solid parts, cannot in most bodies be wholly overcome, and extinguisht by that remedy.

Rondeletius his Treacle Water. *Rondeletius*, doubtless followed these men also, who *de morb. Itali.* commend his Treacle water, which provokes sweat in the inveterate Italian Disease, and takes away the pains, the description of which is this.

Take of Treacle, one pound; *of Sorrel, three handfuls*; *of the flowers of Chamomel, Pery-royal, Pomegranates, blessed Thistle, of each two ounces. Mix them al in white wine and distil them.*

Of which water give three ounces to drink with three ounces of Sorrel and Buglos water, when the Patient goes into his bed or hot house.

Platerus also thinks that it is confirmed by experience, that the decoctions of other plants, besides Guajacum, Sarsaparilla, China, Sassafras; can performe the same in this disease as they do, and therefore fals into this opinion, but evilly. That the late mentioned Medicines which are accounted alexipharmaca of this disease, do work rather in the cure of this disease, by moving sweat, then by an occult quality, and therefore he thinks that not only a decoction of box wood, Juniper, Cedar, Cypress, and Savin, Agallochus, Rose-wood, but also the decoction, and Treacle water, which are given in Pestilent Feavers, are profitable also here.

Whether treacle be good in the Venereal disease. *Aurelius Minadous de lue Vener. cap.* 53. when he had spoken many things in the praise of Treacle at length concludes, that Treacle also may be used against the venereal virulency, as a most excellent Alexiterum, not as if it were to be numbered amongst them, which of themselves are said to expel this virulency, but amongst them, which expel it by accident, in as much as it doth strengthen the spirits, by a Conformable proportion to them, so that they being now made strong, are able as the principal agent, together with the Treacle as their instrument to overcome the maligoity of the venereal virulency.

Trochisks Cypheos. The same Author *cap.* 44. commends Trochisks Cypheos in this Disease, as being such, which do principally strengthen the Liver, which in this Disease is chiefly affected, and free it from Excrementitious Humors, which are collected in this Disease, being powerful to concoct, cleanse, and dry up the Excrement and therefore as *Galen* thought this Composition was to be preferred before al other Medicines written by *Asclepies*, *Andromachus*, and other most Famous Physitians for the affects of the Liver, so he thinks the same is to be used and Magnified beyond al others in this Disease.

But

But as I wil not disswade any one from the use of such common Alexipharmaca in the cure of this Disease, whenas in other cases it is a custome, when any one hath drank poyson, or any waies taken it, and knows not what it is, to give treacle and common Alexipharmaca: so I wil counsel no body. that he confide only in these Medicines, and neglect those proper ones. And I see it done by very few Physitians, as being taught by experience, that this Disease cannot wholly be extirpated without Guajacum, Sarsaparilla and the like, neither doth it follow, that therefore, because some sick of an incurable French Pox, could not be cured by Guajacum wood, that we must place more hope in these Medicaments. For they that could not be cured by those proper Alexipharmaca, wil much less be cured by these common ones.

CHAP. XXI.

Of the Cure by Quick-silver.

Of the cure by Quick-silver.

AND this is the chief kind of Medicine for the cure of the Venereal disease, and this is the chief manner of curing it. For there is also another way of curing the same Disease by quick-silver, which was first brought into use by Chyrurgions and barbers, afterwards also was applyed by learned Physitians. For whenas, as was said before by *Fracastorius*, certain Barbars had found out amongst the Medicines of our ancestors for the filthy scab joyned with the pains of the joynts, unguents compounded of Mercury and Sulphur, other Medicines profiting little, they began to use them. The use of which being not altogether unsuccessful, afterwards quick-silver was used in the cure of this Disease by many learned Physitians.

Quick silver whence so called.

Its wonderful Nature.

But though it be not my purpose in this place to treat of quick-silver, which the Chymists cal Mercury, but rather of the use of it in curing this disease, yet I shal admonish you of a few things in general. Quick-silver is reckoned amongst the mettals, and 'tis called Silver from its color in which it resembles silver, but quick because 'tis alwaies moveable: and its Nature is altogether wonderful, which many learned men admire, and which hath tortered the wits of many Chymists, and deluded their pains. For though it be mortified, fixed, or what way soever it oftentimes seems to be changed, yet it is easily reduced to its former quick Nature. And though it be reduced into the smallest bodies, and transmitted through leather, or be otherwise reduced into atomes, and a strang form, yet it retaines in them its whol Nature and essence, and returns to its former quick body.

Whether Quick silver be hot or cold.

Matthias Unzerus his opinion.

Naturalists and Physitians differ concerning its temperament, whiles some hold it to be cold others hot. *Matthias Unzerus*, hath collected the arguments of both in *Anatom. Spagyr. Mercu.* to alleage al which at large in this place, is not our intent, for you may consult with him on that business in the alleaged place; yet by and by we shal make mention of some of them: but *Unzerus* himself, *cap.* 12. goes the middle way, and holds, that some natural things have oftentimes in them diverse, and wholly contrary vertues and faculties, and some of them are manifest, others occult, and that these depend on the specifick form, those on the first qualities of the Elements, which he proves by the examples of Wormwood, Rhubarb, Vineger, and others: and he thinks Mercury is to be reckoned in the number of these which may be considered both as crude, and as prepared: the crude he thinks hath mixt qualities, and is partly hot, partly cold, and that diversity is to be attributed to the divers parts of the matter of which it consists, some of which are very thin, Subtile, pure, and Spirituous, but some are thick, earthy and feculent: but he thinks that Mercury prepared hath no longer any

cold quality, but they are wholly taken away by the outward help of fire, or by the Application of the menſtrua, and therefore that it is very hot

Hercules Saxonia. *Hercules Saxonia*, holds the ſame *de lue Vener. Cap.* 39. Whiles he teacheth, that this Medicine doth exulcerate, and cauſe heat and inflamation; on the other ſide it cauſeth numnels, Palſies, and other cold affects, and that it proceeds from the inequality of its temperament, and becauſe 'tis an imperfect mixt body, and if it be prepared by calcination, that the cold ſubſtance doth fly away, and that which is left, is fire,

The authors opinion. But theſe authors erre very much. indeed it cannot be denied, that there are many Medicines, which have Heterogeneous parts, by vertue of which, they produce divers effects, which parts alſo may be ſeparated by the help of art: But that Quick-ſilver hath ſuch parts, is falſ, neither was there yet ever found any Chymiſt, who could ſhow the diverſe parts in it, and ſeparate them by art: for the whol is Homogeneous, if there be any thing ſo in Nature, and either it al flies away, or al remaines, and what way ſoever it is prepared, at laſt it al revives wholly Homogeneous: and whatſoever Chymiſt can ſhow any Heterogeneous parts in Quick-ſilver, as in Rhubarb, ſhal be in my eſteem a great Apollo. Neither is precipitate of another Nature then that which is crude, neither doth Quick-ſilver looſe any thing by its preparation, and that prepared does differ from the crude only in external form which is cauſed by the admiſtion of other things, which ſomtimes are Salt parts as happens in Mercury Sublimate and Precipitate, ſomtimes only watry as when Mercury is reduced into water by a retort without the admiſtion of any other thing, as the ſame *Unzerus* teacheth *Lib.* 2. *de Anatom. Mercu. cap.* 2. *n.* 4. for this water is nothing elſe but the Quick-ſilver reſolved into the ſmalleſt bodies or Atomes by the ſtrength of the fire, and mixt with watry Vapors, or the moiſt Air. Yet in that there appeare no effects of cold, but rather of heat, and that very water, as other mercurial waters, wil diſſolve gold in like manner, *Saxonia* is miſtaken, for Quick-ſilver is no imperfect mixt body, but a body that hath the moſt perfect miſtion, and cannot be deſtroied, by any art of the Chymiſts, but every where retaines its form, neither whiles it is calcined (or rather expoſed to the fire, for Quick-ſilver cannot properly be ſaid to be Calcined) do the cold parts fly away, and the fiery ſtay behind, but if thoſe parts which are raiſed up be received, they are of the ſame Nature with thoſe that remaine, as is wel known to the Chymiſt.

Quick-ſilver is Homogeneous.

Quick-ſilver is hot. Therefore whenas this Reconcilation is of no force, let us ſee who is in the righter whether thoſe who hold Quick-ſilver to be hot, or thoſe that ſay 'tis cold. But I think that they are altogether of the righter judgment, who think it to be hot; for that appears by its great penetrating and corroding vertue, ſo that it penetrates and Eats into Mettals, and the fleſh, nay the very bones are corroded by Mercury precipitate and ſublimate. Aud *Libavius* writes in *tract. de igne natu. cap.* 30. that he knew by the relation of a moſt learned Phyſitian, that a certain Chyrurgion dying by the too frequent uſe of Mercurial Medicines, had his bones plainly britle or frangible.

The anſwer of the reaſons againſt it. But whenas they object firſt of al, that whiles 'tis quick and whol it doth not corrode: the cauſe of that is, becauſe it cannot inſinuate it ſelf into the body, and worke upon it, whenas al its parts are moſt cloſely knit together, nor cannot be mixed with other bodies; but the Medicines prepared out of it as Mercury ſublimate, Precipitate, Oyl of Mereury, and if there be any more of this kind, have a great power to burn and corrode not only by the reaſon of Salts commixt, which is very little, but becauſe 'tis reſolved into the ſmaleſt bodies, and being mixt with the Salts it can adhere to the body, and by the beneſit of things admixt, moſt intimately inſinuate it ſelf into it.

1.

2. Secondly, whereas Quick-ſilver appears cold to the touch, that is common to it with ſteel, Brals, Lead, Wine, things of their own Nature hot, which by accident feel to be cold.

Thirdly,

Thirdly, whereas some also from the effects would collect quick-silver to be cold, in that they are very much deceived; and they attribute those effects to cold, which have their dependance elsewhere. Truly, they that drink the waters infected with quick-silver on the Alps, are sick of divers fluxes, and are taken with a bronchocele. Goldsmiths, and others, who often deal with quick-silver, are seldom healthful and long lived, but are obnoxious to numnesses, tremblings, palsies, convulsions, lethargies, suffocating, catarrhs, and appoplexies. Thus *Fernelius* relates of a certain Goldsmith that imprudently admitting the vapour of quick-silver only, presently became stupid, drowzy, and wholly speechless. *Ferdinandus Ponrettus* relates that the same happend to another, *lib.* 1. *de vene. cap.* 3. And *Forestus, lib.* 8. *obser.* 5. writes, That a certain yong man learning the Smiths art upon the arching of a Cup with quick-silver, had all the hair of his head fell off, and that his face became extraordinary pale, and all his body tremulous: and many others have observed the same. And *Jacobus Oethæus, in his observat.* reports, That a certain yong Noble man troubled with Crab-lice in his Privities, used Mercurial Oyntment to drive them away; upon which his Yard grew cold and sluggish, and unfit for Venery. But here is a fallacy of the cause, for quick-silver doth not do these things by cooling, but because it hath a peculiar and occult quality, that is an enemy to the Nerves and Brain, as appears in many other stupifying poysons. 3.

Fourthly, That which is Objected, is easily Answered; to wit, That the damage brought upon mans body by quick silver, is cured by the use of hot things; as Sage, Hyssope, Origanum, Clary, Rue, Castor, and the like: For those Medicaments are not therefore applied to the preternatural affects caused by quick-silver only, because they are hot, but because they are friends to the Brain and Nerves: and furthermore, as they themselves grant, by a specifick property are enemies to the Mercurial virulency; and that such things are not therefore applied because they are hot, but because by a peculiar vertue they are friends to the Nerves, it appears by this, because other hot things, as Ginger, Pepper, and the like, which have no specifick property freindly to the Nerves, do not perform the same. 4.

But concerning the Occult Vertue and Propriety of Quick-silver, we chiefly meet with two doubts; First of all, Whether it be poysonous: next of all, Whether it be rightly applied for the Cure of the Venereal Disease.

Whether Quick-silver be Poysonous.

Concerning the former Question, Whether Quick-silver be Poysonous, we have already treated before, in *tract. at. de Chym. & Aristot. consens. & dissens. cap.* 19. where we speak of Mercury, and we said there, That *Matthias Unzerus de anatom. spagyr. Mercu.* did endeavour to prove at large, That Mercury is not poysonous, with whom others also agree; especially those who urge Experience and the Authority of learned Physitians. *Avicen, lib.* 4. *Fen.* 6. *tract.* 1. *sum.* 1. *cap.* 2. writes, That Quick-silver doth not hurt many that drink it; for that with its qualities goes forth by the stool. *Haly Abbas lib* 1. *pract. cap.* 35. *Rhases in no. ad Mansor. de potu argen. vi.* do affirm the same. *Brassavolus* also doth testifie in *lib. de stirp. exami.* That he hath given Quick-silver to Infants to expel Worms. And *Fallopius de Metallis cap.* 37. holds, That Mercury may be taken into the body without the fear of any hurt; and he relates that Beasts do swallow quick-silver without any harm: For when they abound with Worms, which your Leeches know by their breath, if they swallow four several times half a Filbert shell full of Quick-silver cast into their mouths, they are cured, no worse Disease succeeding it. And he witnesseth that he hath given to Children in extream danger, whom other means have availed nothing, the quantity of two or three grains of Millet with evident success. The same Author, *de Morb. Gallic. cap.* 76. writes, That he saw a Woman which drank a pound of Mercury to cause an Abortion, yet without any hurt. *Matthiolus* also reports in *lib.* 1. *dioscorid. cap.* 170. (which also *Eustachius Rudius* relates, That he hath often observed, when he practised Physick there) That in the Town *Gorritiensis* the Nurses do give Quick-silver to little Children to drink in the

'Tis denied.

quantity

quantity of two grains of Millet for the Worms in the Belly, without any trouble at al. And the Midwives when great bellied Women lie long in labor, do presently give to drink a scruple weight of Mercury without any inconvenience: and *Georgius Agricola* relates, that a certain Woman did oftentimes fraudulently give Quicksilver to her Husband that she might kil him, and nevertheless he continued healthful nay it hath been observed that some thirsty in the night, have in the dark taken up Vessels ful of Quick-silver instead of drinking Cups, and with a wide Throat have taken of the Quick-silver in a great quantity, yet have cast it forth again by the stool without any hurt. And *Eustachius Rudius, add Lib. 5. de Morb. occult. cap.* 15 that he hath seen this, and that others have observed it, that some bodies have been dissected, in which no smal quantity of Quick-silver hath been collected in the Cavities of the bores, from the unction in the French Pox, who notwithstanding have lived many years after the unction. Which seems not possible to be done, if it were poyson by Nature.

'Tis affirmed. But *Galen, Aetius*, the reconciler, *Cardan, Fernelius, Ferdinandus Ponzettus, Jul. Palmarius*, whom I alleaged in the quoted place *cap.* 19. *de. consens. et dissens. Chymic. cum. Aristotele.* do differ from these. And experience it self hath brought most eminent men into that opinion, by which it is evident, that quicksilver doth no less cause numnesses, convulsions, tremblings, palseys, epilepsies, apoplexies, syncopes, than other poysons, nay sometimes death it self. And some do report, that they are seldom long lived, who digg up the veins of quicksilver; and though they be very strong bodied, and of the best temperament, that they can scarce hold out in that work to the fifth yeare, but by drawing in the venenate vapors they are taken with a trembling of al their parts.

The Authors opinion. And the opinion of these we think altogether more consonant to truth as being that which is confirmed by experience it selfe: but as concerning the experience of those, who write that quicksilver hath often been drank and given without any hurt, that doth not excuse quicksilver from its venenosity. For to the compleating of an action, there is required a right application of the agent to the patient, and some stay, which whenas it was wanting in the alleaged examples, the quicksilver could do no hurt for quicksilver is given either alive or prepared, if it be taken alive tis 'less hurtful, for whenas quicksilver is a body most exactly mixt, and the least parts of it do most pertinaceously cohere to one another, from whence also 'tis continually moveable, whiles it is whol and alive it brings little or no dammage to our body, but presently is cast forth by the stool. For in like manner as a leaden, or other mettallick bullet, if it be swallowed whol is presently cast forth of the body, and brings no hurt, but if it be resolved into the least parts, and contract rust, may do very much mischeif, as that history concerning lead doth sufficiently teach us, which *Fernelius* recites *de lue Vener. cap.* 7. So also if quicksilver be taken whol, moveable, and coherent to it selfe, and by reason of its mobility be presently again cast forth of the body, it brings no dammage; but if it be resolved into the smallest particles, and especially with the admistion of salts, and by their help be as it were fixt to the body, and penetrate into it, both inwardly and outwardly applyed, it causeth most greivous evils, as sublimate and precipate do sufficiently teach us, neither is there any reason for any one to ascribe that corroding faculty to the salts mixed; for there is no salt in the fume which exhales when Silver is gilding over, and yet that very fume is highly hurtful; neither can so little salt as is mixt with sublimate or precipitate, cause so great hurt, whenas salt though it be given in a great quantity, doth no such thing.

Mercury prepared. But as concerning prepared mercury, I know indeed, with how great prayses some do extol mercurial medicines. Some cal precipitate the angelical powder, and otherwise prepared mercury of life. Some commend the flowers of mercury of which we spake in *consens. et. dissens. Chym. p.* 365. others mercurius dulcis, and so highly, they write if it be rightly prepared and given 'tis as gentle as manna, tamarinds, cassia, and therefore they use it in the slightest diseases, which might easily

sily be taken away by more benigne medicines. But these commendations are too much, neither is their rashness commendable, who give quicksilver in any disease, whenas we have every where examples of them, who by the use of the medicaments, have not only been cast into danger of their lives, but have plainly perisht by them. Whereupon *Guish. Fabricius* in *Epist. ad D. Doringium lib. 3. observat. annexa.* thinks that that called mercurius vitæ may somtimes be called mercurius mortis, and mercury of life eternal. And how much mercurius dulcis, which is counted the gentleft of al, may somtimes prejudice, was said in the alledged place; but that quicksilver may somtimes be given without any dammage coms to pass, either becaus 'tis crude, or retaines the nature of that alive: and therefore as was said even now, can work little on our body, of which sort is mercurius dulcis, and the flowers of silver mercury, or becaus it is in its kind fixt. For as whol mettals though they be taken into the body, they do not affect it unless they be resolved, so so also whenas fixt mercury doth as it were put on the nature of fixt mettals, so it doth not hurt, as that which is stil volatil, and can easily insinuate it self into the body.

In what disease prepared Mercury is to be given.

Yet prepared Mercury ought not rashly to be used and be given in every disease or body especially at the beginning, but in those only in whom there is great store of vitious humors, which that may empty, and where the body is strong, for as *Mercury* sublimate and precipitate outwardly applied in sordid ulcers, doth mundefie them, and toucheth not the sound flesh as long as there is any filth, but if it be layd on the sound flesh it eats that: so also if quick-silver taken into the body do find corrupt humors on which it may work, it doth not easily damnefie the more inward parts, but it workes upon the humors, and causeth that they be emptied; but if there be no such humors there, it also assailes the sound parts. But whenas Quicksilver given inwardly is not used onely for the Venereal disease, but to drive away many other diseases, we wil speak no more of that here; but let us now inquire concerning it, whether it can, and how it may do good in the Venereal disease.

Whether quick-silver be to be given in the cure of the venereal disease.

As concerning one of them therefore, to wit whether quick-silver ought to be given in the French pox, and whether it may be safely, and by what vertue it acts, Physitians do very much differ. *Epiphanius Ferdinandus* indeed, *Histo.* 17. thinks that amongst ninety Authors that have writ of the Venereal disease, that there are onely foure, who have disallowed of the use of Quicksilver in this disease, viz. Casparus Torellus, Montanus, Minadous, and Fracastorius, but there are many more, which *Johannes Baptista Silvaticus* doth recon up *Contr.* 34. which *Silvaticus* himself is in the number of those, who denny Quick-silver to be an enemy to the essence of the french pox. For *Ulericus abbuten*, a German knight and Physitian *Cap.* 4. *in lib. de morb Gall:* writes that in his time scarce one in a hundred that was anoynted with Quicksilver did escape a relapse, the benefit of it lasting but for a few dayes. *Sebastianus Aquilianus lib. de morb. Galli. Cap.* 4. Cals the cure of this disease performed by quicksilver, sophistical, and writes that al anointed with it in his age suffered a relapse. *Gaspar Torelus* bishop of *St. Justa*, in his declammation against unction with Quicksilver, cals it a pernicious medicine and thinks it is to be shunned as the plague. *Joh. Baptista Montanus*, tract. de morb. *Gal.* writes that quick-silver doth indeed repress the disease for a certain time but does induce an evil quality in the part, and in no wise remove it, wherefore in process of time, al things become worse then they were before. *John Fernelius lib. 2. de abdit. morb. caus. cap.* 14. writes that he beleves nothing less, then that a medicine made of Quick-silver can cure the Venereal disease, since that in his judgment it only takes away the simptoms, leaving the root behind. *Victor Favintinus cap. 7. de morb. Gal.* thinks the cure of the disease with Quick-silver is false, deceitful and daingerous. Neither does *Fallopius* magnefie this cure, as appeares by his book *de morb. Gall. Cap.* 76. *Bernardus Tamiranus* also hath openly condemned this cure *lib. 2. de morb. Gall. cap.* 13. as also some others: to whose opinion

The negative opinion

as I said *John Baptista Silvaticus* joynes himself, and writes that he doth not beleeve, that quick-silver can wholy cure this disease, and that tis an antidote diametrically repugnant to the Venereal evil: he doth not deny indeed that this medicine may allay some evil and vehement accidents of the disease, but that tis diametrically adverse to the essence of the french pox, which is an occult property, inimicous to the liver, and that it can overcome that, he doth not beleeve. But though at the first rise of this disease, Carpus the Chyrurgion first made use of this medicine (whome perhaps that barbor followed, whom *Fracastorius* makes Mention of) being moved by this reason, because he had observed that the ancient Arabian Physitians did make use of Quick-silver against the contumacious scab, and many other rebellious diseases of the skin; yet experience hath no way confirmed this remedy as the best, and therefore it hath been rejected by many physitians: for if Quick-silver were one of the antidotes of this disease it would have alwaies and every where answered the expectation, and there had bin no need that more effectual remedies should have been sought for from the remotest Countries beyond the Seas, which have hitherto been used with most happy succes, that no man doth any farther doubt of their efficacy in this Disease; and though Quick-silver doth heal French Ulcers, yet it doth not follow, that 'tis an Antidote against the Virulency of it as neither those Medicines, which heal Buboes, or Carbuncles in the plague, can for that reason be accounted for Antidotes. *Aurelius Minadous* agrees with these, *Lib. de Virul. Vener. cap.* 39. Who wholy rejects the use of Quick-silver in this Disease, moved thereunto by three reasons; the first is, because he never saw any restored to health by the use of it; on the Contrary he hath rather observed many that by the use of Quick-silver have sufferred worse Symptomes in so much that they have affirmed, they have received greater dammage from the supposed Remedy, then from the Disease: the second is, that Quick-silver is hurtful by Reason of its excessive coldnes: the third is because no body can explain, after what manner Quick-silver doth good in this Disease. To which some add a fourth Reason, that of it self it is poyson; and a fifth that many have died by the use of it.

The affirmative opinion. On the contrary many other Physitians do very much commend the use of Quick-silver in this Disease: and that I may now pass by others, *Epiphanius Ferdinandus, Histor.* 17. writes that he can make good by Oath, that he hath perfectly cured, leaving no evil Symptomes, a hundred and fifty people Frenchified of al Ages; Sexes, and of diverse Temperaments, and at divers seasons of the year; and he names another most experienced Physitian, *Johan. Laurentius Protopapa*, who hath affirmed to him by Oath that he hath cured above a thousand men Frenchified with the Mercurial Unguent with most happy succes, and he writes that we ought to give God thanks, that he would make known so wonderful a remedy for so great a disease.

The Authors Opinion. That we may quit our selves of this difficult controversie, First of al we think the use of Quick-silver is not wholly to be rejected in the Cure of this Disease, neither do the reasons alleaged before by *Minadous*, or others evince it: for first of al as concerning experience, here one experience may be opposed against another, and there are many Physitians who taught by experience it self do with wonderful praises extol Quick-silver in this Disease. The Second reason, that Quick-silver is to be rejected because it is cold, is false, for the effects of Quick-silver as was said before, do teach us that it is rather hot then cold. Thirdly, concerning the manner how it works, and cures this Disease, we shal see hereafter. And though that manner could not be found out, yet the experience must not therefore be denied; for there are many Medicines that work by occult qualities, whose manner of acting cannot be perfectly explained. Fourthly, though Quick-silver be poysonous yet 'tis not therefore wholly to be rejected in this disease, whenas other venenate things come into Physical use, as opium, Cantharides, Oyl of Scorpions and others. But Fiftly whereas some could not be cured by mercurial Medicaments, this is not to be

ascribed

ascribed to the quick-silver, but rather to the ignorance of the Physitian, who did not rightly apply this Medicine, or to the negligence or disobedience of the patient, or to the vehemency of the Disease, which could be overcome by no Medicine, though the best that is.

When quick silver is to be used in the Venereal Disease.

But as quick-silver is not wholly to be rejected, so we think it is not unwarily and rashly to be used, but only upon urgent necessity, to wit then when this disease could not be cured with Guajacum wood or Sarsaparilla. For we must come to the use of quick-silver for two causes especially, the first is when the Disease is so stubborn, that it wil not yeild to those usual Medicines: Secondly when there is something present, which doth not admit of the use of the Decoction of the wood and Sarsaparilla, especially the heat and inflamation of the Kidneys and Liver. And *Eustachius Rudius* writes *Lib.* 5. *Cap.* 15. that he hath cured some, who if they had used never so little of Guajacum, though corrected with cold things, were presently taken so with a heat of Urin, that an Inflamation of those parts arising, they have hardly escaped death; and therefore in such cases sometimes, wil we or nil we, we are compelled to make use of quick-silver, as the same *Rudius* speaketh; and that oftentimes may be done safe enough, so that he writes he hath anointed with quick-silver even infants infected by their Nurses at suck, and hath cured them.

Things prohibiting unction with Quick-silver.

Yet we must not come rashly and inconsiderately to this unction, but first of al we must consider, whether there be any thing present that doth prohibit it: for first of al unction with quick-silver is not admitted, when the strength is but feeble, and therefore in old men it seldom takes place. Secondly, if the body do stil abound with many vitious Humors, for then the qnick-silver doth not easily penetrate: and by a commotion of the Humors it causeth grievous Diseases and Symptomes, therefore the body must first of al be emptied. Thirdly, if the Air be too hot, and if it be dog daies. Fourthly, if the body be extenuated, if there be a Feaver, Ulcers of the mouth, and inclination to a quinsie; this kind of Medicine also is not convenient for them who before the French Pox, suffered numness, tremblings, Palsie, and pains in their joynts.

Whether Quick-silver be an Alexipharmacum of the Venereal Disease.

But that quick silver may rightly be made use of, we must first of al enquire after what manner it is to be given, and what it can performe, and do in this disease, on which busines the hinge of this controversie turnes. Where first of al we are not of their opinion, who think quick-silver to be an Alexipharmacum of this Disease. *Quercetan* indeed affirmes it in *Consil. de lue Vener.* where he writes that Mercury is the only true and sole Alexipharmacum of this Disease, especially if it be inveterate. From whom *Felix Platerus* doth not much dissent, who writes that Mercury by its occult qualities and propriety contrary to this disease, doth quel the Venenate quality of that disease, but this cannot simply be admitted, for when as there are three things in this Disease, first of al that Malignant quality imprinted on the parts dedicated to nutrition, and especially on the Liver, or an occult Disease; Secondly, vitious Humors, generated in the Liver evilly affected, and polluted by this Malignity: Thirdly, Diseases and Symptomes which are raised every where in the body by those vitious Humors, we do not deny indeed that Quick-silver may conduce somwhat to the Evacuating of the vitious humors, as shal be said here after, and hence also to the taking away of the Diseases and Symptomes which do arise from them; but that it doth overcome the malignant and virulent disposition it self, which is the property of an Alexipharmacum, is that which we deny. For first of al experience doth not confirm it, neither hath that Alexipharmacal vertue of Mercury been hitherto proved by any one, by any solid argument; but whatsoever it performes, it doth by salivation and violent purging, which is not the property of an Alexipharmacum, for otherwise al Medicines purging vitious Humors should be called Alexipharmaca. This rather is manifest, that some cured by mercurial Medicines, after a long interval of time

have relapsed into this Disease, that occult and Malignant disposition being left in the body. Secondly, that quick-silver is no Alexipharmacum, appears also by this, because 'tis no way friendly to our body, but rather hurts the brain, Heart, and other Members, and causeth most grievous Diseases and Symptomes in the jawes, which *Platerus* endeavors in vain to remove from Mercury, and to ascribe them to the virulency of the spittle. For thirdly, Quick-silver causeth salivation, not only in the French pox, but also in other bodies, which are not Sick of the French Disease, and besides hurts in the mouth, inflamation, Exulceration, Stinks, injuries of the Teeth, which is obvious for every one to experience and observe, but that is more consonant to truth, that quick-silver is to be numbered amongst Evacuating Medicines, whenas 'tis evident by experience, that by benefit of that, many thick, tough and virulent Humors are emptyed by the mouth, somtimes also by sweat, or other waies, and that it doth not much good in this Disease, unless salivation ensue: therefore when it is applied, it can be used only for this end, to evacuate virulent Humors, which being emptied, whenas the Symptomes caused by them do vanish, 'tis concluded by many, that it may be administred for the Mitigation of the symptoms, when as yet it doth only mitigate or take away the Symptomes by accident, the virulent Humors, on which they depend, being taken away. Which cure notwithstanding, as *Fernelius* is of opinion, is the cruellest of al, and so hard, that many would rather perish of the Disease, than be cured with so great danger, so bitter hazard: but that quick-silver may be applied to external and contumacious Ulcers, is known to every body.

How many ways quick-silver doth Evacuate.

But to evacuate vitious Humors it may be used three manner of waies; either to move by stool and vomit; or to cause sweat; or to cause Salivation and spitting. Concerning the giving of quick-silver to move by stool or vomit is already spoken before, and the Chymists are large in the praise of it; and do extol it with wonderful commendations: and *Crollius* calls Mercury the Balsome of Nature, in which there is both a vertue incarnative, and regenerative, which doth wonderfully renew, and purge from al impurities, and therefore cals it a divine Medicine: to whom *Beguinus* assents, who in *Lib.* 2. *Tyrocin. Chym. cap.* 3. writes that Mercury is the chiefest Alexipharmacum against al corruption and putrefaction: from whom though *Platerus* do not wholly dissent, while he teacheth, that this Disease may easily be cured by purging with Mercury, and truly in no long time, but very speedily, being scarce drank twice or thrice, from whence is raised a plentiful flux of the belly, and also vomiting, somtimes also sweat and Urin is provoked: yet he cannot deny, that it doth perform this by a violent irritation of Nature, and not without danger.

By stool and vomit.

'Tis to be given warily.

But I would have a Physitian rather timorous, than bold and rash in the use of this Medicine, for that which *Pliny* said was the poyson of al things, *Lib.* 37. *cap.* 6. that wil not spare mans body, but offends the stomach, Liver, Guts, and al the bowels, and is especiallly an enemy to the Nerves and brain: but though the Chymists affirme that being prepared it may grow more mild, and that it may not hurt, they precipitate it, sublime it, and prepare flowers of it, *Aquilam*, *Aurum vitæ*, and other things; yet though you expel Nature with a fork, she wil stil returne: for as it was said even now out of *Platerus*, it purges violently and not without danger: and as *Fernelius Lib. de lue Vener. cap.* 17. writes of this business, upon the giving of prepared Mercury, (doubtless he meant precipitate) presently from the compass of the whol body, Humors of al sorts break forth upwards and downwards, with so great force, and so violent, that the spirits being exhausted, and the strength wasted, the sick do either die presently, or lie some daies without strength like unto dead men: somtimes al the mouth is inflamed, and contracts a Gangreen, putrid Ulcers and very stinking, and somtimes the jaws swel, that the Patient for some daies is not able to swallow at al: although somtimes it work more gently, yet it purges violently enough.

But if it do work more mildely, either it retaines the nature of that which is crude, or being fixt it doth almost put on the nature of a fixt mettal: of the first sort is mercurius dulcis, of which *Angelus Sala* saith in the riper aged it works little, unless it be given in a great dose, to wit thirty five grains, and then it easily raiseth salivation; and that this is true a certain Physitian wel known to me, learnt to his cost and found it so by experience, as we have said *de consens. et dissen. cap.* 18. but if it be more fixt, it doth not move the belly; therefore it must needs be that it have a middle nature, if it ought to purge, that it may stimulate nature; where yet alwaies to hold that medium is very difficult. Yet amongst those medicines, we have nominated of prepared mercury, that which is called mercurius vitæ doth easily challeng the first place, so that I think it would be needless to make mention here of more medicines prepared out of mercury; but we must note this concerning mercurious vitæ, that it is no pure mercurial medicine, but there is conteined in it some part of antimony as appears by the vitrum and Regulus, which may be made out of the mercurius vitæ, but can by no art be prepared out of mercury alone, but that they may be made of antimony is wel known.

When it is to be given in the Venereal disease.

Yet when we are minded to administer mercurius vitæ, and other mercurial medicines, we must diligently consider *Mesues* rule, that it is a grane of wisdom, not to come to strong medicines, but where weak ones wil not satisfy. If therefore this evil be new and gentle which may be cured by gentler purgers, and by the decoction of Guajacum or Sarsaparilla, we must not rashly come to the use of quicksilver. But if the evil be stubborn and inveterate, and there be many virulent humors in the body, mercurial medicines may be given without danger: for then 'tis not easily to be feared, that it should assail mans body, when it hath vitious humors enough to work upon. And oftentimes necessity compels us to come to the use of quicksilver, and some do hope in vain, to affect the same buisines by weak medicines often repeated as by stronger taken plentifully at once. For experience hath long since taught us, that we do oftentimes spend our time in vain in such medicines given against pertinaceous diseases. On the contrary that strong medicines, and amongst them quicksilver, after once or more times taking, have happily overcome pertinacious diseases, whose cause was about the stomach, the cavety of the liver, the spleen, pancreas, the cal, and from thence was communicated to other parts.

Sweating medicines made of quicksilver.

Secondly out of quicksilver are prepared sweating medicines, to wit the white spirit of mercury, or the white or red oyl of mercury, one drop of which or two, are given to drink in treacle water and spirits of Guajacum, or some such like decoction to move sweat, as also other preparations and fixt medicaments of quicksilver: and in case that quicksilver performe that, for which end it is given, and move sweat, and discuss the vitious humors by it, 'tis not so dangerous a medicine.

Salivation by quicksilver.

The third way is by Salivation, and many indeed do place al their hopes of the cure of this disease in Salivation, so that *Platerus* writeth, unless that in the cure by quicksilver Salivation be raised by the use of it. And at last be supervenient, the cure doth not succeed, neither is it fitting so much to condemne the use of it and wholy to reject it for the faults which happen in the mouth in this cure, or for other accidents, amongst which convulsions are cheifly to be feared, which are wont sometimes to happen, if there be any great error committed in the use of it, whenas afterwards in the cure the faults of the mouth are easily corrected again. On the contrary *Fernelius de lue Vener. cap.* 6. doth exactly set forth this manner of cure and describes its inconveniences: so great saith he is the cruelty and harshnes of this unguent, that the patient presently begins to languish the second or third day; for by its extraordinary tenuity it doth melt and dissolve, whatsoever is in the superficies and whole compass of the body, and at length by its extream cooling faculty with which it is endued, it drives them to the inward parts, from thence into the stomach and breast, from which afterwards it drives them upwards by a continuity of parts to the throat and mouth, with so great and so violent an injury, that the teeth, to which as also to the brain 'tis peculiarly an en-

emy, do in al presently, grow loose, and in some become blackish and al drop out. Some things it discusses out of the body by sweat, some by its purgative faculty it casts forth by stool, with a great deal of torture. And breifly to comprehend al, al certainly who are thus cured have their jaws exulcerated, their tongue and pallate swollen, their gums and teeth loose, and spittle runs through their mouthes without any intermission, smelling worse then any stink, with so great contagion, that the lipps by touching of that contract ulcers, and the cheeks are ulcerated within: the stomach being cooled and disturbed with the stink, the sick are destitute of any appetite to meat, and being tormented with intolerable thirst, yet they are scarce able to drink, their whol mouth being but one ulcer. Besides their tongue stammers, their eares grow deaf, in some incurably. Al the house about stinks.

When unction with quicksilver is to be used.

And indeed that manner of cure is bitter enough, that one ought not easily to admit of it, and therefore 'tis not be used when the evil is new and light, but when 'tis inveterate and contumacious, and when other remedies as the decoction of Guajacum, Sarsaparilla, and the like, have first of al been tryed in vain; neither must we come to the use of that unless the body before be diligently purged, least too great a quantity of virulent humors be turned rushing to the mouth and jaws; neither is this cure convenient for old men, nor for weak bodies, nor those that are wasted, and are sick of a weakness of the nerves, and have weak heads, and subject to distillations, least by the quicksilver, it being hurtful for them, these parts be more debilitated.

Therefore as *Hercules Saxonia de lue. Vener. cap.* 39. writes of this subject, they are neither to be approved of who use mercurial unctions without any difference, neither must we hold with them, who wholy reject the use of them. For somtimes this disease is so contumacious, that 'tis not cured with the decoction of Guajacum taken fifty dayes, and twice or thrice a day, but grows worse; whenas therefore the patients are weary of taking any more decoctions, and also of sweating, and hungring, that they may not be left without al help, 'tis better to administer a dangerous remedy then none at al.

How quicksilver doth raise a flux.

But what way quicksilver doth raise salivation, Authors do differ, *Eustachius Rudius lib. 5. de morb. occult. cap.* 15. disputes at large of this business, and first of al he worthily derides them who hold that quicksilver by its most intense coldness, or repressing faculty doth repel the humors from the external parts into the innermost parts of the body; for repelling thinges are of thick and dry parts but quicksilver is of most thin parts: neither do other repelling medicines, nay not the most cold ayre, or coldest water, performe any such thing; neither can here be given any reason, why the repulsion should be to the mouth, and not to other parts that are neerer. This therefore must be inquired, why quicksilver is moved to the head, and is cheifly purged through the mouth. Many are of opinion, neither doth that displease *Platerus*, that quicksilver doth cause spitting by a peculiar vertue: but he explains not the manner; neither doth this please *Rudius*. For saith he if quicksilver be moved to the head by vertue of its whol substance, and by a peculiar property, it doth that either by a similitude or contrariety of substance; it cannot be by a similitude of substance, because quicksilver doth rather hurt, then befreind the brain and nerves: and therefore as cantharides do invade and offend the bladder, the Sea hare the lungs, so also in this manner quicksilver seems to assault the brain. But *Rudius* overthrows that opinion two waies, first of al, because he hath proved before mercury, to be no poyson, secondly because he thinks he is able to render a reason from the manifest qualities, why quicksilver doth assault the head; where first of al, he supposeth this that mercury as opium hath heterogeneous parts and that 'tis made up of parts of a different nature, yet so, that the hot parts do predominate; and that 'tis compounded of an aery and earthy substance but very much attenuated with heat, which like unto smoak scarce enduring the heat, flyes away in fume and is dispersed. Therfore amongst al other medicines of this faculty it doth most powerfully extenuate the humors, discuss, and convert them to motion,

and

and therefore doth purge by sweat, by stool, by the mouth, and so partly by its purgative vertue, partly by the heat of its thin parts doth draw the humors along with it, and that it happens so, that the thinner going to the skin are emptied by sweat, but the thick and unfit to be emptied by sweat, being extenuated together with the quicksilver turnd into vapor are drawn up into the head and then causing distillations do fal down again; and at length he concludes, whenas quick silver outwardly anointed doth not remain in the stomach, as other purging medicines do, but assails the head; 'tis no wonder if it principally purge by the mouth.

But indeed he doth not this way satisfie the doubt, and this is a great peice of ignorance both in things phylosophycal and Chymical. For first of al that Quick silver cannot be cleared from venenosety, was said before, and proved, and the reasons for the contrary answered. And *Rudius* himself in the chapter even now alledged, reckons up so many and so greate evils, which mercury doth cause, that they cannot al be reduced to manifest qualities: which that I may compendiously reduce, Quick silver hath a corroding faculty, causeth a trembling and weakness of the heart, hurts the animal faculty, weakens the substance of the nerves and their proper unity, whence are raised incurable tremblings and greivous torments, and many using of mercurial medicines, have suffered convulsions, falling sickness, and apoplexy. Nay the same *Rudius* reports that some after unction have fallen into raving and madness: but whereas he endeavors to reduce that operation of mercury by which it causeth salivation, to the manifest qualities in that he laboures in vain, for first of al there are no such heterogeneous parts in mercury as he phansieth, as was said before, neither could any Chymist ever yet show them, and whether Quicksilver be burnt, or whether it be reduced to water, or what other external forme soever it puts on, it retaines its whole essence, and with a litle labour may be reduced to its ancient forme. Besides *Rudius* renders no reason, why Mercury out wardly anoynted on the body, is rather moved to the head then to the stomach, and carries the humors thither with it: for whereas he thinks, that it is resolved into vapour and carried up into the head, tis fals, whenas it may be collected whol both in the mouth, and in other parts. *The hurts of Quick silver.*

'Tis more agreeable therefore to trueth, that quicksilver is offensive to the nerves and brain, as the tremblings which it causeth do sufficiently de monstrate, and therefore that it creepes up by the nerves to the brain, and carries the vitious humors thither with it, which together with the vitious humors whenas nature and the expulsive faculty of the brain doth expel, and cast down to the jawes, hence follows salivation: and quicksilver whether outwardly applied, or inwardly taken, stil creeps up to the head, and causeth much spitting. *Quick silver an Enemy to the nerves*

But there are divers wayes of using Quick-silver to raise a flux, to wit either 'tis outwardly applied to the body by unguents, plaisters, epithems and lavatories so called, by a girdle, by bracelets and Rings, by suffumigations; or tis taken inwardly, by al which ways not withstanding there is nothing else done, but that the Quick-silver may be reduced into the smalleſt parts that it may the easier penetrate into the body yet what way soever tis broke into peices, it keeps its nature, and the least parts are easily again united to one another and returne to their ancient corpulency, that it hath bin observed, that sometimes a great quantity of it hath bin collected in the veins, and cavities of the bones. *The wayes of using quick silver*

Yet the most common way of applying Quick-silver is by unction; but that unction may be performed rightly, sometimes are to be observed before unction, some in the anoynting, and some after unction, before unction the body, if need require, must be emptied either with purging medicines or bleeding: for if very many vitious humors abound in the body, tis to be feared, that by the use of these unctions they rush together in a heap to the jawes and suffocate the patient, or being rapt up to the brain do cause an apoplexy, or palsie, and therefore first of al part of them ought to be emptyed. Also if their be plenty of blood, least the patient may *How the unction with quick silver is to be ordered.*

suffer

ſuffer an inflamation of his jawes or a feaver, tis good to take away a little blood. *Falopius* alſo, that part of the matter may be conſumed, the bowels ſtrengthened, and not be offended by the Quickſilver, gives the decoction of Guajacum eight or ten dayes before unction.

As concerning the unction it ſelf, the baſis of theſe unguents is Quick-ſilver, which muſt be choſen pure, or vivified by cinnabar, and it muſt be mixed with hogs-greaſe hens-fat, butter, oyl, turpentine that it appeare no longer quick to the ſight, which is commonly called mortifiying of it. Some alſo ad to ſix ounces of Quickſilver, four ounces of red ſugar. Some do mix divers other things to correct the malice of Quick-ſilver, and indeed this or that according to the different conſtitution of the diſeaſe, which notwithſtanding profit little. For thoſe oyly and unctuous things, or other things, do ſtick on the skin and ſuperficies of the body, and cannot follow the Quickſilver into the innermoſt parts of the body, nor correct its malignity. But thoſe things which are neceſſarily mixed, are mixt, to that end, that the quickſilver may be reduced into the ſmalleſt bodies and ſo may the eaſier inſinuate it ſelf into the body. Some alſo in the compoſition of this unguent, think we ought to have reſpect to divers things: and therefore *Hercules Saxonia*, if there be hard knobs, ads thoſe things which do mollifie, as the fat and greaſe of geeſe, ducks, the Marrow of oxe bones, butter, oyle of ſweet almons; if there be ulcers he bids us ad drying pouders, Franckincenſe, Myrrh, aloe, Litharge, white lead, which if they be il conditioned, he ads Cincabar precipitated. Beſides he commands us to mix medicines, which ſtrengthen, the parts: more over he bids us ad thoſe things, which do reſpect the principal parts, and thoſe that are moſt hurt, and therefore if the joynts be affected he bids us ad ground pine; if the liver, hepatick means; if the ſtomach, things ſtomachical, But beſides the reſt he doth aprove of oyle of Guajacum added to the ointment; al which as we do not wholy diſallow of, ſo they ought to be explained. Firſt of al, if the unction be ordered cheifly for tumors or ulcers, medicines may commodiouſly be mixed with it, but if ſaliva-tion and emptying by ſpittle be cheifly intended there is no need of that laborious compoſition. Secondly Quick-ſilver it ſelf if it be reduced into ſmalleſt parts, doth eaſily penetrate, neither hath it any need of helpers, and there is nothing that can penetrate eaſier then that. Thirdly I can ſcarce be perſwaded, that medicines out-wardly anointed, can penetrate to the ſtomach and liver, and ſtrengthen them; this likes me beſt, that he thinks oyl of Guajacum ought to be added to thoſe unguents.

How Quick ſilver is to be prepared.

The Quantity of Quick-ſilver that is uſed, is ſometimes more, ſometimes leſs, according to the vehemency of the diſeaſe, and the patients ſtrength. Yet we muſt not exceed ſeven ounces which is ſufficient for ſtrong bodies, in weak bodies 'tis ſuf-ficient to uſe three foure or five ounces; but every time uſe two or three ounces; of the unguent, or for every doſe take two ſcruples; in tender children for every place ſo much oyntment as is the bulk of a lentil is ſufficient. Such oyntments therefore may be made thus.

The quan-ty.

Formes of Mercurial Unguents. Take *of mercury ſix ounces; of hogs-greaſe without ſalt one pound; Kil the Mercury with the greaſe and mix it exactly, then ad of the marrow of an ox leg half an ounce; of Turpentine three ounces; of the oyl of it one ounce, of the oyl of Guajacum two ounces; mix them.*

Or Take *of venice Turpintine one pound, of Quick-ſilver ſeven ounces; mix them diligently, then ad of hogs-greaſe eight ounces; oyl of ſweet and bitter al-monds of each two ounces, pouder of cinamon two drams; Muſk ſix granes mix it and make an ointment.*

Euſtachius Rudius commends this form, which he uſed with moſt happy ſuc-ceſs for many yeares at Utine, in the great hoſpital of that City, with ſo much ſafe-ty, that not one of them periſht which he had in cure.

Take *ake of Quick-ſilver one ounce and half; Freſh Sows greaſe three ounces;*

pouder

pouder of mastick one ounce; oyl of mastick one ounce and half; Saffron half a dram; two Sweet apples of a middle size. First of al let the sows grease be most exactly mixed with the mercury, then ad the mastick finely poudered together with the oyl of mastick and Safforn, and afterwards the aples through ripe cleansed from the parings and core.

Or, Take *of mercury killed with spitle three ounces; old oyl four ounces; of Frankincense prepared as common mastick two ounces, mastick one ounce; hogs-greese two ounces and half; oyl of bayes one ounce and half; virgins wax two ounces; ointment of dialtbæa one ounce and half; sagapen one ounce; of wax as much as is sufficient. Make an Ointment.*

Or Take *of mercury two ounces; of hogsgrease three ounces; turpentine one ounce; pouder of orice frankincense, mastick each two drams; oyl of chamemel, white lillies, bayes of each two aunces; Stirax half an ounce; mix them.*

Or Take *of hens, hogs, and beares greace each one ounce; oyl of white lillies, bayes each two ounces; mercury six ounces; mix the greases in a morter, afterwards ad the mercury, and stir them an houre in the morter, then ad of frankincense mastick, myrrh, amoniacum, stirax, pouder of Arabick, lavinder each half a dram make an ungnent.*

The Places which are anointed are the joynts and the spaces between, and the less fleshy parts in the hands, elbows, feet, knees, sometimes in strong bodies the emunctories of the liver are anointed, and the backbone. *Fallopius* expects the hands, and first of al anoints the feet transversly about the begining of the feet, afterwards the spaces between the joynts of the leg, then the midle of the thighs, the middle of the Elbow bones, and the midle of the Armes, afterwards the whol back.

The time for anointing.

The most commodious time for anointing, is the spring and autum, the winter and summer are less convenient and the unction is to be performed in the morning, upon an empty stomach, in a close and warm place, beginning at the lower parts, and so passing to the upper unction is seldom ordered twice on the sameday.

The patient anointed must either be ropped up in linnen, or the parts anointed be covered with course flax or hemp and so the patient be placed in his bed.

How long unction is to be continued.

But the unction is to be continued so long, til salivation or a loosness, or some other evaccuation succeed; and the symptomes be lessened and cease; and truely if a loosness follow, it is not suddenly to be suppresst, yet we must have a care least the guts suffer any hurt, casting in by Clyster chaly beat milk, or the juyce of ptisan with milk, or the decoction of barley and afterwards if need require, come to astringent meanes.

Some think that sweat also ought to be moved; but if nature tend to salivation, tis not convenient to move sweat, least there be contrary motions caused; but if nature of her own accord tend to sweat, tis not to be hindered, yet unction is scarce to be continued above three dayes at one time; sometimes also there presently follow greivous symptomes as great ulcers of the mouth, swellings and inflamation of the tongue and jawes, the swallowing is hurt, the teeth loosened, an extraordinary flux of virulent humors from the mouth, a diarrhy or dicentery, and then we must presently forbear anointing, yet sometimes it hapens but very sildom, that no such greivous symptom followes. But only sweats, and pustles are multeplied al over the body.

What is to be done after unction.

When unction is now perfected, and the spitle runs wel, let the parts anointed be washt with wine, in which sage, Arabick, lavender, flowers, rosmary, grownd pine, bayleaves, calamint origanum have bin boyled, afterwards lay upon them some plaister for the nerves.

At last when the unction is past, we must use our endeavor, that the mercury be not left in the body, and that no evil be contracted neither in the mouth nor other parts; and therefore we must move sweat in a Laconick bath keep gold money in the mouth, shaveings of gold must be dranke, or bullets or pils made up of leafe gold must be swallowed: for the mercury is imbibed by the gold, and with it is emptied out of the body, and so al evil that might happen is prevented.

To

To asswage pain, the mouth and jawes must be washed with warme milk or the Decoction of Barley: to hinder inflamation let the patient use the decoction of plantaine or plantaine water, or of Vine leaves, with the syrup of Mulberries and dry roses, the teeth must be washed with the decoction of sage, or with Sage, columbine water, or austere wine; after unction we must not presently desist from the cure, but the decoction of Guajacum as being the alexipharmacum of this disease, must be drank stil for certain days, which if it be intermitted, a relapse is wont easily to follow upon it.

Mercurial plaisters. Secondly, emplasters made of mercury are wont to be applyed in this disease, which though they cause less trouble, yet they are less effectual to empty by spitting. They are prepared of the same matter of which the ointments are, to which also we may ad cinnabar: but quicksilver either is mixt with usual plaisters, as diachylum Ireatum, melilot, or new ones are compounded. The plaister called de ranis with mercury, is also in use. These plaisters are spred upon linnen cloth, leather, and are applyed to the same places as the ointments, especially to the hands and feet, also to the emunctories, and sometimes to the back bone, and they are worne continually night and day, and every third or fourth day are renewed: this cure is less troublesome, and upon faire daies the patient may go abroad, yet the cure is not so perfect, and therefore must be continued longer.

Lavatoris of mercury. Thirdly, Linnen clothes wet in mercury water, are applyed to the same places in the forme of an epitheme, and becaus sublimate is most commodiously dissolved in water, the same places which are wont to be anointed, are besmeared with mercury dissolved in this manner, which medicines are commonly called lavatories, which are prepared of mercurius sublimate one ounce, which is disolved in two pound of some liquor.

For Examples sake.

Take *of Mercury sublimate one ounce; of Scabious, Rose, Fumitory water, each eight ounces; Sage water four ounces. Let them boyl and be mixed.*

The use of it is this, with a cloth wet in this liquor, let the knees and feet be besmeared, and the armes from the elbow towards the hands, and that must be done in the morning and towards the evening, in a warme place and continued for ten days, til spitting follow.

Mercurial girdles and bracelets. Fourthly, Girdles and bracelets are made of Mercury killed with spittle and mixt with the white of an egg, which mixture is spred upon cotton, and that is sowed into leather or cloath, and of that girdles or bracelets are made.

Suffumigations of mercury. Fiftly, Also this disease is cured by suffumigations made of quicksilver, but this way of cure is more dangerous than that by unction, nay it hath been deadly to some, and therefore is not to be made use of, unless al other meanes have been tried in vain, and only on very strong bodies; for this way of cure is very violent, whenas the patients that do admit of it, every day are wont to voide ten pints of virulent spittle; but it takes not place in those that are weak, wasted, endewed with a hot and dry distemper, not in those, which are troubled with a difficulty of breathing, or are subject to distillations from the head on the breast, or who spit blood, or are taken with a lientery, or dysentery: but physitians do cheifly use those suffumigations in a contumacious French ophthalmy, and upon an imminent shedding of the haire, which cannot be hindred by other medicines; for this suffumigation doth fasten the haire. Yet then a particular suffumigation may be appointed.

Their difference. For we must note here, that there is a difference of suffumigations in this disease; for some are universal which are received by the whol body, and therefore also do empty the whol body; others particular, which are applyed only to certain parts: again some suffumigations are prepared of benigne medicines, as frankincense, myrrh, oyl, Cinamon, Styrax calamite, spikenard, Amber, Ammoniacum, benjamin, wood of aloes, Amber greese, Musk, Gallia moschata, and the like, which though they may be fitted for the use of certaine parts, yet they do not destroy the venereal disease. Those

Thoſe therefore which are proper to this diſeaſe, are chiefly prepared of mercury and of thoſe things made of Mercury, cinnabar, Mercury precipitate, ſublimate.

As concerning thoſe univerſal ones, their baſis as was ſaid even now, is mercury any way prepared; ſome ad the Greeks Sandarach, and yellow arſnick, but whenas they are moſt pernicious poyſons, they are not ſafe enough applyed, neither do they cure this diſeaſe in particular that we may give you ſome formes.

Formes.

Take *Of Factitious Cinnabar three ounces; Myrrh, Frankincenſe, Maſtich, each one ounce; Liver colored aloe, Styrax calamite, Benjamin, each half an ounce: make a pouder.*

Or Take *of Cinnabar three ounces; Myrrh, Frankincence, wood of aloe, Laudanum, Ammoniacum, each one ounce; mix them with turpentine, make pills.*

Or Take, *of Cinnabar three ounces, Mercury precipitate three drams; Frankincenſe, Aloe, Maſtick, Myrrh, Benjamin; Styrax Calamite, each half an ounce: make a pouder. Epiphanius Ferdinandus* reports the following forme is much in uſe at *Naples* in the Hoſpital for thoſe that are incurable.

Take, *of Litharge five ounces; of antimony, Cinnabar, each one ounce; of Pontick Rhubarb ſix ounces; Polipody of the oake three ounces. Sweet cane, Cinamon, Laudanum, Roſes, Mace, Nutmegs, Alum, Verdegrece, Aloe, each three drams; Red lead, the Greeks Sandarache, each one ounce. Gumme caranna, two drams; Water of Roſes and Citron Flowers, as much as is ſufficient, mix them according to art.*

But it ſeemes to me to be a forme made up without al reaſon which containes many things unprofitable, and alſo hurtful.

That is ſafer which *Ferdinandus* himſelf propoſeth.

Take *of Cinnabar, Mercury ſublimate each one ounce; Gumme of the Olive tree Laudanum each half an ounce; Nutmegs, Bay and Juniper berries, each three drams; Marjoram, Coppras one dram and an half; Turpentine as much as is ſufficient to incorporate it, make a maſs.*

The manner of preparing theſe ſuffumigations.

But thoſe medicines whether they be reduced into pouders, or pills or trochisks, are uſed after this manner: firſt of al the patient that he may be able to undergoe this cure (fit ſauce for him, and they are deſervedly thus handled who defile themſelves with luſt) you muſt give him two reare eggs, a morſel of bred dipt in ſtrong wine, and a draught of wine, and a ſpoonful of conſerve of roſes; then let him reſt quiet for a quarter of an houre; in the interim let that Venereal bed, or rather priſon, viz the ſweating place be heated, and in that hot houſe or dry bath prepare a tent, or a pavilion of thick linnen cloath, under which the patient may ſit naked in a low ſeat; under the ſame pavilion place a pot or veſſel ful of burning coales, on which by degrees caſt either the pouder, or the pills, or trochisks, that the fume from thence may be diſperſed through his whol body, and be received by the naked body of the patient; when the ſmoak abates, ſtrow freſh water on the coals, and continue ſo doing for a third or fourth part of an houre, for half or a whol houre, as the ſtrength of the patient can indure it. For we muſt carefully obſerve, that the patient faint not, which doth often happen; if it be collected by his ſtammering ſpeech, he muſt preſently be taken forth and be refreſht with fitting medicines. But that faintings may be prevented, the patient may be permitted to draw the cold ayre by intervals through a reed, and put forth his noſe without the pavilion.

But theſe ſuffumigations are applied either once or twice a day and indeed for three, ſix, or nine or more daies, according as the purgation doth ſooner or later ſucceed, for when this comes, or a looſneſs, we muſt preſently ceaſe from the ſuffumigation. After the patient hath ſweat ſufficiently under his tent. Being wrapt up in linnen he muſt be laid in his bed, that he may there continue his ſweat for an houre or two.

Particular ſuffumigations.

But particular ſuffumigations are not applyed to the whol body, but only to parts

parts exulcerated or affected with pain; but then Salivation is not moved, neither is that the intent, but it is used only to take away diseases and symptomes in the external parts, viz. for the falling of the haire suffumigatons are applyed to head; to the hands and Feet for their paines, and when they suffer Chaps and Clefts.

Internal Medicines causing Salivation. Last of al also a flux may be raised by taking Quick-silver inwards which though it was not known to *Fernelius*, yet it hath been taken notice of by the more modern, and Quick-silver is used to this end by *Rondeletius*, *Platerus*, and others. Such are those Pills called Barbarossa which have Quick-silver in them; but Physitians give Pills made of Mercury so, that at one dose there is given six or seven grains of Mercury, and they give them almost every day, and so long, til a flux followeth, and this cure they continue for thirty daies. Yet *Platerus* admonisheth that this kind of cure is not easily to be admitted, and not unless the Disease be inveterate, when other Medicines premised availe nothing. He also thinks that it is commodious, if it be presently cast forth by stool either by its own weight, or by the admistion of other things; but if that be done, doubtless it wil not cause Salivation; therefore 'tis better that Mercury what way soever prepared, be given in a less dose, than can cause purging either by vomit, or stool: viz. that the half, or third, or fourth part only of that dose be given, which otherwise is wont to be given to purge. For example sake, precipitate or Turbith Mineral is wont to be given at other times to vomit or purge to the weight of six grains, but if only three, or two, or one be given, by the continued use of it a flux is raised: and therefore he that would use such Medicines, shal do very right, if first of al he give the ful dose of the Mercurial Medicine to purge, the second day half so much, the third day a third part, the fourth day a fourth part, and continue so, til the spittle run, yet he need not so precisely observe it: and tis altogether safer in this disease to give those Mercurial Medicines, which do not move the belly with great violence, nor so great danger, yet by their continued use do provoke spitting.

CHAP. XXII.

Of the Diet to be observed in the Cure of the Venereal Disease.

Diet. The Air. A Diet in the cure of this Disease is strictly to be observed; first of al let the Air in which the Patient is conversant, be hot, that insensible transpiration may be free, and sweating be not hindred, but rather promoted, yet not so hot, as to make faint. Therefore if need require let the patient keep himself in a warm chamber the whol time of his cure, and let not him expose himself to the free Ayre, unless it be somwhat hot by reason of the season of the year, and then not before noon. Yet they whose course of life wil not allow them to keep at home, let them guard themselves with Cloaths against external cold, and as much as they can shun the cold Air.

The Meat. Whether a slender diet be convenient in the Venereal disease. As concerning their Meat, there is much discourse indeed every where in this Disease concerning a slender Diet: but whenas a slender Diet is that which doth in some sort impair the strength, or which doth little preserve the enfeebled strength, such diet is only convenient in acute diseases, which whenas they last not long, the strength also somwhat debilitated is able to hold out to the end of them: but whenas the French pox is a Chronical disease, and the Cure is extended for many weeks, if the strength be dejected by a slender diet, it cannot hold out till the end of the disease. But that Physitians do chiefly feed their Patients with bread and raisons, I think this is the cause, because they would give the most simple food, and that of good juyce: for whenas variety of meats doth easily supply vitious humors, and flesh, and fish, and the like meats are more easily corrupted, then bread and raisons

they

they prohibit the sick variety of meats and flesh, and would have them contented only with bread and raisons: therefore that course and form of diet is to be observed which may suffice for the conservation of strength, though not to encrease it, but must no way oppress Nature. The meat also must be of good juyce, and simple, and which no waies affords matter for the generation of excrements, nor may call away Nature from resisting the Disease to the concoction of that. And therefore the patient must not be allowed above two dishes, and meat must be given but twice aday; therefore when the sick is prepared for the use of Medicines, let his diet be such which may not impair his strength, but rather preserve it, nay, in some sort encrease it, that the patient may afterwards be able to undergo the evacuations that shal be ordered, and a more slender diet: but when Sweaters or Quick-silver is administred, if the strength wil bear it, we must use a more spare diet, lest the vertue of the Medicines be hindered by plenteous nourishment, and let the superfluous humors in the body be rather wasted, than heaped up, and let the passages by which they ought to be expelled, be al kept free and open: but let not the diet be too slender, lest the strength fail, but be able to hold out til the perfect cure of the disease, which is wont to be long first; and though somwhat is to be bated of the accustomary diet in the cure of this disease, yet that is not to be done presently at the beginning, nor that change is not suddenly to be made; but the first eight daies by little and little, somwhat must be substracted from the accustomary diet; as also the last eight daies of the Cure, by degrees he must return to the former course of diet; yet we must alwaies have respect unto the strength, and diligently consider what that is able to endure, and we must have a greater care of that, than of the disease, as without which the Cure cannot be perfected.

But how much concerns the quantity of the meat, we must also respect the strength, and the disease; for by how much the strength is stronger, by so much 'tis able to suffer the less quantity of meat; but the strength is demonstrated by the habit of the body, the temperament, custom, the age, season of the year, the Country, and condition of the sick; of which we have spoke in its proper place. In brief, as much as possible may be, somwhat must be bated of the accustomary food, which also the people of *India*, from whom the manner of curing this disease was derived to us, are reported to do; yet so, that alwaies respect be had unto the strength: For if the patient be strong, his Body of a cold constitution, that he can easily endure hunger; flesh is not to be given any more after eight daies, but the patient must be content with bread and raisons: but if the strength be weak, the body slender, cholerick, some flesh also may be granted, viz. the flesh of Chickens, Hens, Partridges, Veal, Kid, and tender weather, as also Hens Eggs: but Hogs flesh which is hard of digestion and distribution, and doth encrease the morbifick matter, is chiefly to be eschewed; as also corruptible Fruits, and soft fishes: and truly the most commodious Food in this disease, is raisons, and to be preferr'd before al other meats: besides, they do not easily putrefie, and they afford good juyce and nourishment, and correct the malignity of the vitious Humors; whence some are of Opinion, That Raisons in this Disease are not only meat, but medicine too; and especially those greater ones called *Cybebæ*, are most proficable, in which there is greater plenty of nourishment, and a more abstersive and strengthening faculty.

What kind of bread is to be given.

Concerning bread here is some doubt; many commend Bisket, nay admit of that only, which as we do not disallow of in strong bodies, which are moist and abound with flegm and excrements, being inclined rather to putrefaction, then adust, and in those who have strong teeth, and are accustomed to it: so also Bread once wel baked, and not too moist, may safely be permitted, as a nourishment most familiar to al Natures, Sexes, Ages and any season of the year: neither must we cause any trouble to the patient, by forbidding common bread, if he desire that rather then Bisket: nay Bisket seems to have its discommodities; for it staies longer in the stomach, and is not so easily disgested, and for the right disgesting of it there is need of a greater strength of the stomach, which notwithstanding for the most part in

thoſe that are ſick of the French Pox is very languid: beſides whenas in thoſe ſick of the Venereal Diſeaſe for the moſt part aduſt Humors do abound, by Bisket they are increaſed, on the contrary by common bread as being more moiſt they are made temperate, and at length more nouriſhment and good blood is afforded from it, as being beſt tempered, and in meats that which is beſt tempered, is to be preferred before that which is intemperate.

Many alſo do weigh out the quantity of the meat, and write that at one meale, four ounces of bread, and two or three ounces of fleſh wil ſuffice; but this cannot be ſo accurately obſerved in al men, but here there is no ſmal regard to be had to Natures and cuſtome.

Their drink. As concerning their drink, Authors alſo do not fully agree concerning that, ſome think nothing is to be given for drink but the decoction of Guajacum and Sarſaparilla, and wholly forbid wine, and think tis as much to be denied in this Diſeaſe, as in a pleuriſie, and are of opiniou that wine is not ſo much as to be taſted of, the whol courſe of the cure; and *Fernelius* writes that wine is ſo averſe to Guajacum, as tis to Hemlock, *de lue Vener. cap.* 13, But for this cauſe chiefly they forbid Wine, becauſe the body and Humors which before were aduſt, and which grow hot by the uſe of Guajacum, by the uſe of wine are inflamed. But indeed this reaſon ſeems not ſufficient; for that Second decoction may heat as much, as wine, if it be thin and dilute and moderately drank: therefore the ſtrength is here to be conſidered, and whenas wine hath a notable agreement with our body, and doth ſtrengthen the heart and al parts, and eſpecially the ſtomach, is moſt eaſily diſtributed into the whol body, doth moſt ſpeedily nouriſh, and ſo fortifie Nature, that it may the better be able to oppoſe the Diſeaſe; the uſe of it is not ſimply to be rejected, eſpeciallly in thoſe who are leſs hot, and have a flegmatick body ſtuft up with crude Humors; yet the uſe of wine is ſo to be moderated, that it do no way inflame the body; but thoſe that can abſtaine from wine without any hurt, let them drink that ſecond decoction made of Guajacum and that plentifully at meals, and other times, when they are thirſty, yet they to, may ſometimes take a drauft of wine to ſtrengthen the ſtomach. After the ſame manner if the Cure be ordered by Quick-ſilver, at that time when Evacuation is not yet made by the mouth and ſpitting, and the patient can chaw meat, he muſt be nouriſht with the beſt bread and good fleſh, and dilute wine muſt be given him: but when Salivation begins, and the Patient can chaw no longer, by reaſon of the looſneſs of his teeth, he muſt be nouriſht with ſuppings, and Barly Ptiſſan, and fleſh broaths with bread in it, and whenas an Inflamation of the jaws is feared, he muſt abſtain from wine. But after the cure is finiſht, though the Patient may reurne to his accuſtomary Diet, yet tis moſt convenient that he be nouriſhed with meats of good juyce, from which the beſt blood may be generated; for whenas the body is extenuated, and the veins emptied, we muſt wholly take care, that the body or Veſſels be not filled with vitious blood, but tis commodious that they be reſtored and filled with good. Neither muſt it be granted, that upon recovery he preſently ariſe from a ſmal quantity of meat, to a great, whenas al change to extreames is dangerous. And when it may be feared, that the Liver be heated by the uſe, of hot and dry Medicines, conſerve of Roſes, Violets, the pouders of the three ſaunders, Diarrhodon Abbat. muſt be given for ſome weeks; and let the courſes of diet, eſpecially in Summer time, be cooler, provided chiefly of Barley, the Whey of Goats Milk alſo is good. But if there be any fear, that ſome reliques ſtil and Malignant diſpoſition of this diſeaſe be remaining in the body,

Wine of Guajacum. give a Phyſick wine made with Guajacum and Sarſaparilla which is moſt commodiouſly prepared at vintage time, if to every Gallon of wine one pound of Guajacum, and three ounces of Sarſaparilla be added, and let cool with the new wine after the accuſtomed manner; but out of vintage time thoſe Medicines may only be ſteeped in Wine.

Sleep. Sleep is not only convenient in the night, but alſo a day times, when the Patients ſweat, it may be granted.

Al

Al violent exercise is hurtful; for whenas the strength is impared by it and there is a greater transpiration and dissolution of the body, thence it comes to pass, that the patient cannot be content with that smaller portion of nourishment, which is wont to be used, in this Disease. But he must wholly abstaine from Venery, as the greatest enemy to this Disease: let sweating in his Chamber be instead of exercise, and frictions which may be done with the same labor when the sweat is wiped of: let the affection of his mind be composed to mirth. *Exercise.*

We must use our endeavor that the belly be kept loose, and whenas by reason of the smal quantity of meat it is wont easily to be bound, it must be loosned with Clysters, and Raisons with leaves of Seny; nay by intervals to give some purgers is not only profitable, but also necessary: for though those Laxatives do empty the first passages, yet because they reach not to the more distant places, and by sweaters only the thinner parts are Evacuated, but the thick are left behind, tis good after seven or ten daies, or after a longer space, or need requires, to give a purging Medicine agreeable to the body of the Patient. *Excrements*

CHAP. XXIII.

Of the Cure of the Diseases and Symptomes, which are wont to be joyned with the Venereal Disease.

WHenas divers Diseases and Symptomes are wont to be joyned with the Venereal Disease, some are very large in explaining, what way those Diseases and Symptomes ought to be removed: but whenas those Diseases are for the most part manifest, and we have treated of their cure in former Books, I think it not worth my pains to treat at large of them in this place: and therefore I shal only alleage certain few things, and those principally which are proper to this Disease, let the rest be fetcht from their proper places.

Ulcers.

As concerning the Ulcers of the Yard especially, which are very common in this Disease, we have spoke of them in general *Lib. 3. Pract. Part. 9. Cap. 11.* that we may add a little, the Root of the Yard being guarded with a defensive Oyntment, the Ulcer must be washt with the Decoction of Scabious, Horehound, and especially Soape-wort, and Guajacum: afterwards let the Ulcer be anointed with some convenient unguent; those Oyntments are chiefly profitable, which have Mercury in them, either a live, or sublimate, or precipitate, or Cinnabar. And in Ulcers of the Yard, and rottennes of the Nut, as they speak *Hercules Saxonia* writes there is no Medicine yet found out more profitable then precipitate: yet it ought not to be applied, but where there is a thick filth, but in clean Ulcers tis not to be used *Eustachius Rudius Lib. 5. de Morb. occult. Cap. 19.* commends two Oyntments especially. The first is: *The Cure of Venereal Ulcers in the Yard.*

Take *of Oyl of Roses, sweet Almonds, of each half an ounce; Oyntment of Rozin (which is made of pure oyl, Rozin of the Pine, Turpentine, and Yellow Wax) six drams; Mercury Precipitate, one dram; a little Wax. Mix al over the fire, except the Mercury precipitate, and taking them of the fire stir them carefully, til they are cool, then add the precipitate; yet according to the Nature of of the Ulcer, and the part affected with it, you may add more or less of the Mercury precipitate.* *The Mercurial Unguent.*

The

The other is this.

Take *of* Oyl *of* ſweet Almonds, Oyntment *of* Roſes, *of each three ounces*: *new wax, one ounce*: *Mercury precipitate half an ounce.* *Mix them.*

And thoſe Oyntments are good not only for the Ulcers of the Yard, but for French Ulcers of other parts, for the Diſeaſe called Ficus, ſwellings in the Fundaments, and Cruſts.

The Balſame of Mercury alſo is good, which is thus prepared.

Take *of Quick ſilver diſſolved in ſpirit of Nitre, to one pound of this diſſolution, pour of* Oyl *of* Olives, *three ounces. Let them ſtand and digeſt eight daies, afterwards ſeparate the oyl and keep it for your uſe.*

Or, Take *the Yelk of one Egg boyled hard, Honey one ounce. Mix them over a gentle fire, let them boyl, and add of Mercury Sublimate, half a dram.*

After mundification this Oyntment alſo may be uſed.

Take *of the beſt aloe, half an ounce*; *Crocus Martis, two drams*; *Frankincenſe, red Lead, of each one dram*; *Honey, half an ounce*; *Turpentine, two drams*; *the Yelk of an Egg. Mix them.*

Hidden Ulcers. But occult and hidden ulcers are wont to lie hid either bound up under the fore-skin, or elſe are in the internal paſſage of the Yard; if the Ulcer be under the fore-skin contracted, either a convenient medicine is to be injected by a ſyringe, and afterwards a tent dipt in oyntment is with a probe to be applied to the part affected or the fore-skin muſt be cut long waies, and neceſſary Medicines be layed to it.

Ulcers in the paſſage of the Yard. But if the ulcers be in the very paſſage of a mans Yard, they are hard to be cured, and have caruncles joyned with them, or fleſhy excreſſences, which hinder the emiſſion of the urine, therefore in a ſlight ulcer, we muſt inject Plantane water, in which Alum, litharge, and white Lead have been boyled, but in more grieous ulcers, uſe this Liniment.

Take *of Mercury precipitate, one ounce*; *Mercury ſublimate, one dram*; *burnt lead, two drams. Grind them on a Marble ſtone, waſh them often with Roſe-water, and let them dry in the ſhade. Afterwards take of Hogs Fat, ſix ounces*; *White Wax, two drams. Let them be diſſolved over the fire, and add the pouder, and two ſcruples of Camphire. Make a Liniment, which muſt be beſmeared over a Candle made of five ounces of White Wax, and one ounce of Turpentine, and let the Candle be put up into the Urinary paſſage: or let ſome convenient plaiſter wrapt over a ſmal probe, be thruſt in: the Caruncle being taken away a drying and conſolidating oyntment muſt be caſt in.*

In the womb But if there be an ulcer in the womb, and that ſordid and creeping, the evil is incurable: but the ſlighter are cured by injections of Alum waters, in which Guajacum and Sarſaparilla is boyled, or with peſſaries of the juyce of Plantane, with pouder of Aloes, Bole Armenick, white Lead and the like. In a very ſordid ulcer the Oyntment Ægyptiacum may be added, or ſome Mercurial unguent: and at laſt a drying and conſolidating Oyntment may be uſed, as that of Tutty, or the like.

In more grieous ulcers ſuffumigations of the Womb are moſt profitable, but whenas the Pipes are overheated by the coals, theſe candels of *Hercules Saxonia* are good for a fume.

Take *of Styrax, Calamite, Beniamin, of each ſix drams*; *wood of Aloes, ſeven ſcruples*; *white Frankincenſe, one ounce*; *Ladanum, one dram and an half*; *Orrice, Cloves, of each two drams*; *Damask Roſes. ſix drams*; *Cinnabar, two drams*; *coales of Willow, half a pound*; *Aqua Vitæ as much as is ſufficient. Make Candels.*

By the ſame Medicines the ulcers of the Guts are Cured.

Ulcer of the Jaws. But to the ulcers of the jaws whenas ſuch Medicines cannot be applied make a Gargariſme of the Decoction of Sarſaparilla, the bark of Guajacum, the Leaves of

of plantane, scabious, mittle, red roses, pomegranate pil, sumach, to which ad a little alume the decoction may be made in water, and towards the end ad a little austere wine; after they are washt, the ulcers must be clensed with oyl of sulphur, adding a convenient liquor, or the compound water of alum, which is thus prepared.

Take *of mercury sublimate, roch allum, each one ounce; Grind them on marble stone, then ad to them juyce of Lemons three ounces, plantane water one pound and an half; rose water nine ounces; Boyl them in a glass to the consumption of the fifth part.* *The compound water of alum.*

But you must have a care, that no part of such medicines be swallowed down; butter of antimony so called is very efficacious, if the ulcer be gently touched with a piece of cotton moistned with the butter; but there is need of the same caution here: but whenas it cannot alwaies be prevented, but somewhat wil slide into the stomach, and so such medicines cannot be given safely enough; but on the contrary, other more gentle medicines are of little efficacy, these ulcers are hard to be cured, nay oftentimes are incurable; the solution of gold is more safely applied to these ulcers, prepared after this manner.

Take *fifteen leaves of Gold, roch alume, nitere, Salt, each one ounce; grind them on marble, and poure to it some drops of spirits of vitriol; afterwards poure on it spirits of wine two fingers bredth above it, and let them stand in warm ashes, last of al boyl, that the leaves of the gold may be dissolved, and the spirits of wine grow yellow. Seperate the Spirits of wine by distillation, then poure more on again and digest it, and do this so often, til the spirits of wine dissolve the gold, and the salts be left at the bottom; at last seperate the spirits of wine by distillation till tis dry, and pour on spirits of turpintine and digest it eight dayes in a warm place, till the gold be dissolved, with this solution wash the part affected twice every day.*

Ulcers of the nose are cured by errhines, or infusions, by pouders strewed on it, by suffumigations made of Guajacum and cinnabar. *Of the nose.*

Clefts of the hands and feet.

If there be chaps and clefts in the palmes of the hands and soles of the feet, let them be washt with the decoction of Guajacum, its barke, scabious water, germander, cinquefoile; and if there be hardness with it, take also marsh mallowes, or the root of wild cowcumber, afterwards use an ointment of butter, goose-grease or hens, ammoniacum, bdellium, apples, to which ad a little of unslaked loome, or precipitate, or the oyntment proposed before. *Clefts of the hands and feet.*

Or Take *of hogs-grease as much as you please, and put as much oyl of tartar to it, that by it the oyntment may be made sharpe.*

If the evil yeeld not to these, apply a particular suffumigation of cinnabar; *Hercules Saxonia de lue vener. Cap.* 30. writes that he hath observed a certain woman who for eight years together had clefts in her hands, and had used the help of al the Venetian and Padua doctors to no purpose, was in a short time easily cured with the juce of an herb, which some cal mugwort, others tansie, being carefully dropt with a feather into al the clefts, and forbearing to wash her hands at al, and that he hath found the same juyce profitable in ringworms and Crusty Ulcers.

Buboes.

Concerning buboes which are wont often to break forth in the groines in the Venereal disease, we must hold fast this in general, that we do our endeavor, to help the expulsion of that matter, which nature assayes and indeavors to thrust forth to the more ignoble parts; whenas sometimes by this evacuation nature is wont to free her *The cure of buboes.*

her self from al that disease; therefore if a buboe break not forth enough, and increaseth but tendeth not to suppuration, we must use our endeavor to draw it forth and suppurate it. Therefore the thigh of the same side must be rubbed, and scarified about the lower part, or else a vein must be opened about that place; but on the bubo it self there must be layd strong drawing medicines. As,

Take *of sagapen, Ammoniacum each three drams; opoponax, Bdellium, each two drams; mustard, pepper, Pellitory of Spain of each one dram; blacke sope half one ounce; mix them and with wax and pitch, make an emplaster.*

Yet if nature be oppresst with the plenty of virulent matter, that it cannot expel it al, then 'tis good to give a purge, that part of the burthen being taken off, nature may the easier expel the rest.

When the tumor hath broke forth enough, we must take care it be speedily opened, and be kept open a long while; that it may suppurate we must lay on it those maturatives, which are wont to be applied in inflamations, of the mucilage of mallows, marsh-mallows, wheat and flax seed, figs, hogs-grease, goose-grease, and the like; or the simples diachyled, or that compound with gums; when 'tis mattered, we must not expect that the bubo should open of it self, but it must be opened betimes, least the virulent humor detained there do hurt other parts; the tumor being opened the forementioned digestives and abstersives must be layd on, to which there will be need sometimes to ad a little of mercury precipitate, and the ulcer must be kept open a long time.

Yet in cold buboes there is no such feare, that the matter should ascend to other parts, but if purgers and sweaters, and proper alexipharmaca be applied, sometimes the bubo doth wholly vanish without any danger.

Gummosities and Nodes.

Truely Such tumors and nodes, which do rise in places void of flesh, as the forehead, the skul, and the outward part of the legs, do oftentimes vanish, if the disease be perfectly cured; especially after the use of sarsaparilla, which is most effectual in discussing of these diseases; and after the use of mercurial unctions, which are applied to such tumors yet if after the cure is inded such tumors and nodes remain, things emmolient, attenuating, and digesting must be laid udon them, and that are strong, as the roots of wild cowcumber, bdellium, sagapen, opoponax, and cheifly ammoniacum, or diachylon with gums, or a mercurial cerote; this is good and proved by experience.

Take Of the plaister diachylum with gums one ounce; simple diachylum half an ounce; mercury killed with spittle one ounce, oyl of guajacum as much as is sufficient make a plaster.

Or, Take *of Ammoniacum, Opoponax, Gume of ivy dissolved in aqua vitæ, hens and goose grease each one ounce and half; the marow of a calfs leg one ounce ladanum, styrax, calamite, and liquid each two drams; the pouder of hermodactil roots orrice, each three drams; cinnabar one dram; quick silver mix with turpintine six drams; oyl of lilies and wax as much as is sufficient, make a cerote.*

Also the lavatories made of mercury, mentioned before, are good in these tumors.

If these things do not satisfie, the tumors must be opened with caustick, especially if they be not in the joynts, nerves, tendons, and the place must be kept open, and the bone underneath, which for the most part is hurt, must be scraped.

Smal

Smal Bunchings and pustles.

Bunchings also and smal pustles, thymi, verrucæ, favi, as in other parts of the body, so especially they are wont to rise in the head, about the arsehole, yard and privities in the french pox: which though sometimes after a universal cure they vanish of their own accord, yet sometimes also they require a peculiar cure. *Bunchings and pustles.*

This sort of bunchings which are in the head, must be washed often with the decoction of guajacum, and cheifly of the barke of it and sarsaparilla; some use oyl of scorpions and vipers: to which if they yeeld not, they must be anointed with some mercurial unguent, or the compound water of allum, prepared of roch allum and mercury sublimate, which some also prepare thus.

Take *Of roch allum, Mercury sublimate each two drams: grind them, ad of plantane and rose water each one pound: Boyl them in a glass to the consumption of half, afterwards let them stand fifteen dayes that the allum and mercury may sink to the bottom, and let the cleare water be poured off, and kept for your use.*

If the pustles be in the mouth, use washing of the mouth with the decoction of guajacum, or if there be an inflamation, with chalybeate whey, to which may be added roses and plantane; and if the pustles be foule, ad scabious and ten graines of alum to every pint of the whey or decoction. The compound alum water even now described is most profitable; yet in pustles of the mouth, tis not safe to use that alone, but it must be diluted with a treble or quadruple quantity of rose and plentane water. But the pustles of the arsehole and yard, must every day be often fomented with a linnen cloth wet in the decoction of guajacum and sarsaparila; for the same the alum water even now described is very good: or if the evil be stubborn, some ointment must be laid upon them, with pouder of precipitate, such as were proposed before, or precipitate mixt with foure times as much of the white of an eg; wch layed upon such excrescenses of the arsehole, in 24. houres space extracts and roots them out: afterwards drying and cooling things must be layed on. Some cut off the french warts with Scissers, and afterwards take out the root with the medicines even now proposed: also if the extream part of the wart be toucht with oyl of vitriol, it dries up and falls off.

Falling of the Hair.

The falling of the haire wich is joyned with this disease, doth happen rather from the knawing off, of the roots of the hair, than from other causes, both in the head and beard which that it may be cured, generals being premized first the hair must be shaved off, if the patient wil allow it: for al do not admit of it, especially religious men, whose diseases must be kept private as *Herculer Saxonia* writes *de lue Vener. Cap.* 38. then astringent things must not be used, by the use of which the evil is made worse, and ulcers and paines of the head do follow upon it the matter being retained: but those things rather are to be used, which do discuss and clense away that vitious matter which eates of the haires: as a lye in which have bin boyled Guajacum and its bark, sarsaparilla, leaves of fumitory, berony, scabious, southernwood, wormwood peny royal, asarabacca, agrick: and if the skin be dry, mallows marshmallowes, pellitory of the wal must be added: then the other medicines must be applied, which are propounded *lib. 5. pract. par. 3. sect. 2. cap. 3. and 4.* al which if they satisfie not, particular suffumigation for the head and face, must be prepared of quick-silver and cinnabar, by which remedy in the space of six or nine dayes, the falling of the haire is stayed. But for the most part, if universal purgers, and emptiers be applied, and the matter knawing the haires be taken away and proper lotions be used, afterwards haire doth succed of its owne accord in the place of that that fel away, see more in the place alledged *de Alope. et Capil. defluv.* *Falling of the hair.*

Pains.

The Cure of pains. Also most grievous pains do often afflict those who are sick of the Venereal Disease; but they are most commodiously taken away by medicines proper to this disease: but Sarsaparilla is chiefly good to take them away; therefore if the pains be very urgent, on the first daies you must take a greater quantity of Sarsaparilla, and a less of Guajacum: and though the matter being dissolved and melted, the pains be encreased til the second week, because Sarsa hath an extraordinary attenuating faculty, without any astriction of the bowels; yet we must not desist from the use of it, but the patient must be told of it: afterwards when the pain is ceased, we may encrease the quantity of Guajacum, and China Root may be added also to mitigate those pains: but by intervals, almost every week, give proper purging medicines; but to the places pained apply fomentations of Guajacum, Leaves of Penyroyal, Sage, Rosemary, Chamomel flowers: Oyl of white Lillies also, of Rue, Scorpions, Vipers, Guajacum, are good: if the pain be very urgent, we may give also Laudanum Opiate. Upon the use of al which, if the pain depart not, those mercurial Unguents, which we propounded before in the universal Cure, must be anointed on the places pained; or by the addition of wax make Cerotes of them, and lay them on the parts pained, or some other plaisters above propounded; to which also may be added, Castor, Hermodactil Roots, Orice, and other Arthritical Medicines; especially *Vigo*'s Cerote of Frogs is of good use to lay asleep those pains: and this Cerot of *Platerus* is good too.

Take *of Quick-silver three ounces; stir it with one ounce of Turpentine washt with Aqua vitæ; adding Bears grease, the marrow of a Calves Legg, of each an ounce and half: Oyl of white Lillies, Chamomel, Dill, bayes, worms, or Foxes, of each half an ounce: Spike or Turpentine two drams: Euphorbium, Frankincense, of each half an ounce: Liquid Styrax six drams: Hermodactils two drams: Castor one dram: Wax as much as is sufficient. Make a Cerote.*

Also the aforesaid Lavatories prepared of Mercury, formerly propounded, applied to the parts pained, especially the Legs, do allay the pains.

The Running of the Reins.

The Cure of the Running of the Reins. The Running of the Reins, which also is frequent in this Disease, is not to be stopt at the beginning, nor rashly: whenas Nature doth endeavor to purge the virulent matter through that place, which if it be suppresst flies up to the Head, nay infects the whol Body: but if it do not stop when the decoction hath been used til the third week, let the Region of the Loyns, and Perinæum, be anointed with astringent Oyls, made of Mastich, Mint, Roses, Mirtle.

But let Medicines be given of the seed of the Chast-tree, Lettice, Hemp, to which add a double quantity of the pouder of Sarsaparilla: and those Medicines may be given either in the form of a pouder, or with Syrup of Water of Lillies, be reduced into the form of an Electuary. 'Tis good also if every day there be given two or three drams of Water-lillies, with one or two scruples of Turpentine: Some also do give for this Running of the Reins, green Mercury precipitate, or the Rozin of Guajacum and Turpentine, which is washt with Violet Water, and adding the Yolk of an Egg, and the Decoction of Sarsaparilla, 'tis reduced into the form of a Potion.

A Consumption.

A Consumption. At last it often happens, that either by the violence of the Disease, or the Cure not rightly ordered, the sick come into a deep Consumption: For the Cure of which, the common Medicines for a Consumption wil not suffice, but there is need of

of Specificks. Which kind of Remedy *Audovicus Septalius animadvers. Lib, 7. n.* 214. doth propound, and writes that by it, he hath wholly freed very many from this disease, and from such a Consumption. But 'tis prepared thus.

Take *of choice Sarsaparilla cut smal, six ounces; infuse it twenty four hours in fifteen pound of warm water, in a warm place, in a vessel shut: afterwards boyl it with a gentle fire till five pound be wasted: then with a spoon perforated take out the Sarsaparilla, and bruise it in a marble morter: then cast it into the same water again, adding two pound of lean Veal, Coriander seed prepared one ounce, or instead of it, so much of the shavings of Guajacum, or three drams of yellow Sanders sliced, according to the condition of the Patients body and humors: and the vessel being covered, let it boyl again with a gentle fire, till there remain five pound; and towards the end aromatize it with three drams of choice Cinnamon: then strain it, squeezing it hard, and keep it for your use in a glass or glazed vessel.*

Of which let the patient take in a morning four hours before meat, six or seven ounces; but in the evening three hours before supper, four or five ounces: And if it be Summer, or a Hectick Feaver is joyned with it, he adds of Barley excoriated or husked, four ounces: and he continues the use of this Medicine many dayes, sometimes to the hundreth day.

Let the rest be sought for out of the Cure of the particular Diseases, and out of *Fallopius de morb. Gal.* who hath writ at large concerning the Diseases and Symptomes which are joyned with this Disease.

F I N I S.

Mris. *Culpepers* Information, Vindication, and Testimony, concerning her Husbands Books to be Publisshed after his Death.

SO great are the *Afflictions wherewith our* Heavenly Father *hath been pleased to exercise me his poor* Handmaid, *that I have not only lived to see my* dear Husband, (*the* Stay *and* Solace *of my Life*) *taken from me: but it hath been my hard hap also to see his* Reputation, *and* Memory (*which wil be dear to al Posterity, for the works he hath written for the Common Good of this Nation*) *blemished, and Eclipsed, by the* covetous *and* unjust Forgeries *of one, who, though he calls himself* Nathaniel, *is far from being* an Israelite in whom there is no guile; *who was not content to publish a* Hodgpodg *of* undigested Collections, *and* Observations *of my deer Husband deceased, under the Title of* Culpeper's last Legacy; *but to make the Deceit more taking, he steeled his Forehead so far, and brased it so hard, as not to be ashamed to forge* two Epistles, *one in mine, and the other in my Husbands Name; of the penning of which, he nor I, never so much as dreamed: And yet he* impudently *affirmeth in my Name, that my Husband* Laid a severe Injunction on me to publish them for the general good, after his decease; and that they are his last Experiences in Physick and Chyrurgery. *And in the Title of his Book, he said,* They are the choycest, and most profitable secrets, resolved never to be published til after his Death. *Al which Expressions in the Title and Epistles, are as falf as the Father of Lyes; and every word in them, forged and feigned. And he knew wel enough, that no discreet, honest man, that was a friend to my* Husband, *or me, would ever have agreed to such infamous and dishoneſt practices; and therefore I desire all Courteous Readers of the Writings of my Husband, to take notice of this* Deceit, *and to assure themselvs that it never entred into his head, to publish such an undigested* Gallimoffery, *under the promising and solemn Name of his* Last Legacy, *and that* whereby he gained his Reputation in the World, *as the Impostor makes him speak in his forged Epistle. And I desire any in different Reader, that hath observed my* Husbands losty, and Masculine manner of expressing himself in his Prefaces, and Epistles Dedicatory, *whether in case he had been minded or disposed to take so solemn a farewel of the world, as the* Forger *makes him to do; whether, I say, he would have done it in such a* whining fashion, *and so in the Stile of a* Balade-maker, *as to say,* And now, if it please Heaven to put a period to my Life, and Studies, that I must bid al things under the Sun farewel: Farewel to my dear Wife and Child, farewel Arts and Sciences, farewel al worldly Glories, adiew Readers. *Certainly my Husband would have been far more serious, and material, in such a case, as any discreet man wil Judg. Neither can it be thought, that in such a solemn* Valediction, *he could possibly forget his wonted respects to the* Colledg of Doctors, *to whom he did so frequently address himself, in divers of his writings.*

Courteous Reader, *I shal say no more touching the abuse of the Book-seller, only to prevent (as much as concerns me) thy being abused for the future, know, That my Husband left seventy-nine Books of his own making, or Translating, in my hand, and I have deposited them into the hands of his, and my much honored Friend, Mr.* Peter Cole, *Book-seller, at the* Printing-Press, *neer the* Royal Exchange *(for the good of my Child) from whom thou mayest expect to receive in print, such of them as shal be thought fit to serve thee in due season, without any Disguises or Forgeries, unto which I do hereby give my attestation. Also my Husband left seventeen Books compleatly perfected, in the hands of the said Mr.* Cole, *for which he paid my Husband in his life-time: And Mr.* Cole *is ready and willing (on any good occasion) to shew any of the said seventy-nine Books, or the seventeen, to such as doubt thereof.*

And if any Person shal question the Truth of any part of this Vindication, or Epistle; if they wil take pains to come to me, I wil face to face, justifie the truth of every word thereof, as I have subscribed my Hand thereunto in the presence of many witnesses.

I profess in the presence of the great God, the searcher of al hearts, before whom Mr. Brooks *and I must one day give an account of al our Actions: That I have not published this Epistle or Vindication, out of any dis-respect to Mr.* Brooks (*for I much respect the man, and would be glad to serve him to my power*) *but only to cleer my Husband from the folly and weakness cast upon him by the means above expressed. And out of tenderness to Mr.* Brooks; *I first tried other means of keeping, and afterwards of repairing my Husbands Credit, and then stayed long to see if he would repair (in any measure) the wrong done to my Husband, and my self. I desire to be:*

Your Servant (in,
and for the Truth)
Alice Culpeper.

From my House, next door to the
Red Lyon in Spitale-fields,
October, 18. 1655.

Mris. *Culpeper* did the 18. of *October*, subscribe this Epistle in Vindication of her Husband's *Reputation*, before Ten Witnesses, as she had done another Epistle on the ninth of *October*, almost in the same words with this, except neer the Conclusion.

A TREATISE OF THE GOUT.

Chap. I. *Of the Nature of the Gout.*

THe Gout is by the Greeks called *Arthritis*, from *Arthron* signifying a Joynt; but by the Latines it is termed, *Morbus* or *Dolor Articularis*; and by us in Englisſh it hath its Name from the place affected, and in general is called the Gout. The more Barbarous among the Latin Phyſitians cal it *Guta*, becauſe that this Malady is excited by a flux, made as it were drop by drop. And there are likewiſe of the more Modern writers, who follow theſe; yea they prefer this Appellation before all other whatſoever; but yet not ſo rightly, as anon, in the firſt Queſtion, we ſhall ſhew you. *Its Name.*

But now, albeit that *Arthron* (as by the Author of the *Medicinal Definitions* and *Introduction* it is defined,) be the *Compages* and Compoſition of the Bones, ordained for the motion of the ſeveral parts; yet here notwithſtanding in this place, by the word *Articulus*, or joynts, we are not to underſtand the very *Compages* of the bones; and the *Syntheſis* or Union of them; or the Extremities of the Bones that are conjoyned; or the ſpace betwixt the Bones, which are Joyned together by the joynt: but the parts that Joyn the very Joynt together, and encompaſs it; eſpecially ſuch of the parts as are endued with ſenſe, to wit, the Membrans, Membranous Ligaments, the extremities of the Muſcles, and the Nerves that are inſerted in theſe parts. *Arthron what it is.*

But in regard that the Joynts are various, from the difference of theſe, and from the variety of the parts affected, the Gout (which the Greeks cal *Arthritis*) hath alſo received divers and different Names; and if the Feet be affected, it is called *Podagra*; if the Hands, *Chiragra*; if the Hip, *Iſchias*; if the Knee, *Gonagra*; and many other of theſe words, derived from the place affected, and the Greek word *Agra* which ſignifieth a taking or ſeizing upon; ſo that *Podagra* is nothing elſe but the taking of the Feet; and *Chiragra* the taking of the Hands; in regard that theſe members are in this Diſeaſe as it were taken, and by it enſnared, and held faſt: even as by *Lucian* (in his *Tragopodagra*) the Gout is brought in thus ſpeaking: *The differences of the gout, according to the variety of the Joynts.*

By the moſt of Men I am called Podagra, *being the taking, and deteining of the Feet.*

But in the other Joynts it hath no ſpecial name, but by a common and general name it is called *Arthritis*, that is, the Gout; like as alſo in general, it is then called *Arthritis*, when at one and the ſame time a pain ſeizeth upon many of the Joynts together. But the truth is, that ſome certain men there have been who have feigned & made very many ſuch like words as theſe; and among the reſt, *Ambroſe Parry*, (in his firſt Chapter of the Gout:) and if the Malady be in the Joynt of the Jaw they call it *Siagonagra*; if in the Neck, *Trachelagra*; if in the *Spina Dorſi* or Back-bone, *Rachiſagra*; if in the ſhoulder, *Omagra*; and if in the Joynt of the

Elbow, they term it *Pechyagra*. But we meet with no such Names as these in any of the Greek Authors; neither indeed are they commonly used; although that these Grecians themselves tel us very often that the *Arthritis* may be generated in many parts of the Body.

Mentagra what it is. And in *Pliny* also (in his 27. *B. Chap.* 1.) we meet with the word *Mentagra*, as first invented (as he saith) in sport, and merriment, (for it is a vitious medley Composition of a word, from a Latin and a Greek word, and such as the learned are never wont to make use of) but soon after notwithstanding it became common: but the truth is, that Affect belongs not to the *Arthritis* or Gout; but it was a certain foulness and nastiness of the face, and a kind of Scabbiness, perteining, and to be referred unto the *Lichenes*.

The Latines have likewise retained the Greek words, since that even from them they received the Disease also. Touching which *Pliny* in his B. 26. Chapter, 10. The *Podagra* (saith he) *Was wont to be a Disease more Rare, and not only a stranger unto the memories of our Fathers and Grand-Fathers, but even unto our own also. For had it been anciently known in* Italy, *it had ere this time received a Latin Name.*

And yet notwithstanding it is here to be observed, that although the word *Podagra* be properly taken for the pain of the Feet; Yet sometimes also (as even *Crato* in his 253 *Consil.* confesseth) by an appellation borrowed from one Member, the word *Podagra* is to be taken and understood for every kinde of Gout in what part soever; in regard that so it is wont to happen, that the Feet for the most part, in the first place, and more frequently are taken, and affected with this Disease; and they also are very seldom free, when the other Joynts are affected. And hence it is also, that *Lucian* inscribeth that *Dialogue* of his, which is touching the *Arthritis* or Gout in general, by the name of *Tragopodagra*. And so they that have written in praise of the Gout *Podagra* (as *Cardanus*, and others) they all of them seem to treat of *Arthritis* or the Gout in general. Yea and certain Physitians there are that treat properly of *Arthritis* or the Gout in General, and yet they inscribe these their Tracts, *de Podagra*, or of the Gout (in special) of the Feet.

What place the Gout most frequently invadeth. To wit, most frequently this pain invadeth the Feet; and indeed most of al, and in the first place, the great Toe of the Foot. For Nature (as much as she is able) is wont to drive forth the vitious Humors unto the extream and remote parts; and the Feet are likewise more remote from the Fountain of heat; and they are also more in motion, by which the Humors are drawn unto them. And from hence it is that *Galen* (in the sixth *Sect.* of the *Aphorisms*, *Aphorism.* 28.) writeth, that al those that are troubled with the Gout, that is to say, with the pains of all the Joynts, they are first of all taken with the Gout *Podagra*, or the Gout in the Joynts of the Feet. This indeed for the most part so happeneth, but yet not alwaies. For in some the Gout begins in their Hands; and some have it first in their Knee, and in some it beginneth in some other of the Joynts. And albeit that it first of al seize upon the Feet, yet notwithstanding it afterwards also for the most part invadeth the Joynts of the Fingers, or those places that are about the Hand Wrist, as also the Joynts of the Arm and Elbow, and sometimes likewise the Neck, and the Joynts of the Jaw-bone. And indeed this Evil in the first beginning of it (for the most part) seizeth upon but one of the Joynts, either in the Foot, (which most usually happeneth) or else where; but then afterwards, (the bowels being debilitated by the thick and often returns of the Disease, and the Native heat being much impaired, and the matter dayly more and more heaped up) it then invadeth more of the Joynts; so that it often cometh to that pass, that there is scarcely any Joynt or Juncture of the bones throughout the whole Body that may be said to be free from this Malady; and as *Lucian* (in his *Tragopodagra*) writeth, *This Evil tortureth and tormenteth the affiicted and Miserable Body, from the very Fingers ends, even unto the extream parts of the Feet, and the ends of the Toes.*

Yea, and oftentimes it comes to that, that the vitious Humor is not only poured out into all the Joynts, but likewise into other sensible parts; as it hath been often observed, that in some this Humor hath been so poured forth into the Teeth, that it hath there caused a pain; and in others (in whom it hath been poured forth unto the breast) it hath there excited a spurious and bastard Pleurisie.

But

But now this Malady is not wont to continue long at a time, but to afflict the party by certain intervals and Periods, whiles the matter heaped up is thrust forth unto the Joynts by certain intervals; which indeed in the beginning are somwhat longer; so that the Diseased persons are often free for six months, and somtimes likewise they are free from this Gout for a whole year together; but then afterwrads the Bowels and the Native heat being much weakned and impayred, and many vitious Humors being heaped up together, the Malady returneth by shorter intervals, somtimes after three months, and somtimes every month; Yea and some there are, whom it doth continually afflict and make them to keep their beds. *The period of the gout*

Now *Arthritis*, or the Gout, is in the general defined to be, *A pain of the parts about the Joynts, excited from the defluxion of a serous and sharp Humor, and poured forth into them out of the Veins and Arteries.* Or, if it please you rather to define it in any other manner, when a swelling doth now concur with it, you may then say that it is a *Tumor or Swelling about the Joynts, arising from a defluxion of the serous or wheyish, and sharp Humor by the Veins and Arteries unto the place affected; and by reason of the extension of the Membranes about the Joynts, and the Acrimony of the Humors Twinging and pulling them it hath Joyned with it a pain, and hinderance of motion.* *The definition of the Gout in general.*

And because that the Nature of this Disease is such, that when it hath once begun to infest and trouble a person, the Body can hardly ever be so carefully looked unto, and well ordered, but that upon every sleight cause and upon the least occasion given it will again return, and indeed by certain Periods, (somtimes once a year, somtimes every six Months, and now and then once every Month:) many therefore of the most learned Physitians do likewise add this in the definition, that it is a pain or swelling returning by certain intervals and Periods. But if there be any one that thinketh it therefore to be omitted, because that he who is at the first troubled with the Gout, and so hath not suffered many Paroxysms returning by intervals, yet may be truly said to be affected with the Gout: yet Notwithstanding, he cannot deny this, that the very Nature of the Disease is such that even in the very first Paroxysm the Disease is in it self naturally fit to return by intervals; like as he who is at first taken with a Tertian or Quartane Feaver, is truly said to be troubled with a Tertian or a Quartan, albeit that he hath not yet undergone many Paroxysms or fits returning every Third or Fourth day. *Whether it be proper to the gout to return by intervals.*

Franciscus India indeed blameth those that define the Gout by a pain, in regard that neglecting the Disease they define this Malady by its Symptoms. But it is no new thing, to define some certain Affects (in the which the Symptom and the Disease concur) by the Symptoms, as more urgent, more troublesom and grievous unto the Diseased party, and more manifest in themselves. And so the Phrensy is defined by a Deliry, and the Pleurisie by a pain; although that there be in both places present a Disease, to wit, an inflammation. And therefore there are many of the ablest Physitians, both Ancient and Modern, who inscribe their Tracts touching this Affect, *of the pain of the Joynts.* Neither again may the Gout be here alwaies so fitly defined by a Tumor or swelling, in regard that oftentimes there is no swelling evidently appearing in the External parts; and yet nevertheless the pain is then greater and more vehement then when there is a swelling in the part. But *India* himself is very much mistaken and greatly erreth, whiles he defineth this Malady by a defluxion.

And moreover, although that every Gout that happeneth about the Joynts may be called a pain (and in this manner this name may be also attributed unto pains that happen in disjoyntings, Contusions, or bruises and blows, wounds, that which is in the French Pox, that which happeneth unto Virgins while their Courses are flowing from them, or such as happen unto the Hips of great Bellyed Women that are neer the time of their Travail, or in general, unto all pains whatsoever that happen about the Joynts:) yet notwithstanding, we do not here take the word Gout in so large a sence, but in a more eminent and especial manner we here by this Name understand that peculiar kinde of pain which the Germans cal *Das Zipperlein*, arising from a sudden influx of a Humor into the Joynts, insinuating it self into the more hidden and inward parts of the Joynts, and returning by intervals and Periods. *Whether every pain of the joynts ought to be called the Gout?*

The

The subject of the Gout.

The subject of the Gout (if it be defined by pain) are only the Membranous parts, and those parts about the Joynts that are endued with a quick sense and feeling. For a Membrane being the Adequate subject of the Touch, even here also those parts that are grieved with pain do suffer it as they are membranous; from which nevertheless we may not exclude the Membranous Ligaments. For although that *Galen* teach us that all the Ligaments want sense, yet notwithstanding we are not to deny sense unto the Membranous Ligaments, which (as we finde by experience) are very sensible of pricking, and the Gout it self doth evidence it. Neither is that Reason they commonly alleadg to the Contrary of any great weight and moment, to wit, that a Man should be alwaies Obnoxious unto pains, and never free from exeruciating Tortures, if the Ligaments that are sensible of pain should dash and strike against the bones: for Nature hath so fenced and guarded those parts, and so admirably ordered it, that no such thing can happen. And hence it is that we daily lay hold on with our hands, and walk upon our Feet, in which there are very many Tendons, Nerves, and Membranes, and yet nevertheless we are not sensible of any pain. But if it be defined by a Tumor or swelling, then all the parts that joyn together the Joynt, and lie round about it, may be said to be the subject of the Gout. But now that these pains are excited more about the Joynts, then elsewhere, the Cause is this, to wit, that the Veins and Arteries pour forth in these places (in the which there is a Concourse of the Membranes and Nerves) those Sharp Humors which Nature endeavoreth to expel, and which cannot flow forth in the middle Channel of the said Veins and Arteries; and because that the Humors arriving at the seat of the Joynts stick fast in these more streight and narrow places, where all the parts that end there are joyned together, and infolded the one within the other; whereas elswhere they might more freely be moved up and down, and have room enough to dispersе themselves hither and thither.

Whether al the Ligaments want sense

And indeed, the truth is, that now and then that Humor is also diffused into other parts; and there is a certain Nameless Author, who (*in the eighth Section of his B. of the Gout, added unto the writings of the principal Physitians*) telleth us, that these kind of fluxions do not only infest the Hands, Feet, and all the joynts, but that it likewise maketh an impression upon the very Head, upon the very Liver, yea and sometimes upon the very Heart it self. And *Hieronymus Capivaccius* also (in his *Consil.* collected from *Scholtzius*, *Consil.* 226.) maketh mention of the Gout pain in the side; by reason of which the sick person was constrained to lie upon his Back, neither was he able to move his sides. And a person of Honor once told me (as I remember) that a certain man afflicted with the Gout, felt likewise very sore and grievous pains in his very Yard: and it was related unto me by an Honorable Lady, that a Kinswoman of hers being troubled with the Gout, a certain Marl (for so she called it, and indeed not unfitly) brake forth also in her Fore-Head, so that it might have been even swept off like sand, and grains of Salt. But the truth is, the Cause breeding the Gout, if it be in great abundance, it may likewise be diffused into other parts besides the joynts, but yet notwithstanding it doth not breed the Gout any where else but in the joynts.

Why those who are troubled with the Gout do seldom suffer any convulsion?

But now it may here in this place (and that not without good cause) be demanded how it comes to pass that those persons that are afflicted with the Gout do yet so seldom suffer any Convulsion (but only a pain) whenas yet the Nervous parts are here affected, and indeed so twinged and pulled by the sharp Humor that there may seem to be great cause for the exciting of a Convulsion? *Thomas Erastus*, in his 4. *Disputat.* against *Paracelsus*, thinks this to be the Cause, that the Humor that is poured forth about the Nerves is wateriſh and Flegmatick, and therefore doth more loosen then extend them: and if this be not the Cause, he confesseth ingeniously that he is altogether ignorant of it, and knoweth not what it is. But yet we do not acknowledg this for the only true Cause; neither is it indeed a truth that the Humor exciting the Gout is simply wateriſh and Flegmatick, that rather looseneth then extendeth the parts, as we shall hereafter prove, and as it appeareth even by the pain it self, which is most sharp and intollerable. And therefore I conceive the cause hereof to be in the place affected, to wit, that not the very Nerves themselves (as they are inserted into the parts destined unto motion, *viz.* The Muscles that serve thereunto) are affected, but rather the Membranes, and the Membranous Ligaments, which parts are not ordained for motion, neither serve they thereunto;

The opinion of Erastus.

and

and therefore although they suffer most grievous pains, yet nevertheless they excite no Convulsive motion, unless haply the Brain be drawn into consent; like as we may plainly see the truth of this in the pains of the Teeth, the Eyes, the *Pleura* Membrane, the *Colon* Intestine, and the like pains; in all which it is not the Nerves (appointed for motion) but rather the Membranes that are affected, without any kind of Convulsion. And the very same happeneth in the Gout, in which the membranous parts that are about the Joynts, and knit together the extremities of the Joynts, are either distended, or twinged and pulled by the Humors flowing thereunto.

There are some indeed who assert, that the very Cavity or hollow space that is between the extremities of the Bones do receive the Humors that flow thereunto, and that this space is the true subject of the Cause breeding the Gout. But this is false, as anon we shall shew you in the *Third Question*.

The *Proxime* or next Cause of the Gout pain (as in other parts likewise) is the solution of Continuity, which is produced by the afflux of the sharp Humors into the Membranous parts about the Joynts either by distending them, or else by their acrimony at once both pricking and pulling them.

Now those things that accompany this pain, are First, an impotency and weakness of the motion; and by the motion of the joynt the pain is irritated and augmented. And then also a swelling (and this for the most part with a redness and heat) followeth upon it, and is discerned more especially in the extream joynts; and yet nevertheless, there appeareth now and then only a moist and waterish swelling without any redness at al. In the Hip and Shoulder blade (being fleshy places) there scarcely appeareth any swelling at all externally, but the Humor that hath flown thereunto lieth hid and covered by the flesh. And there is also a Feaver (a continued one) that almost alwaies with a pain invadeth in the *Arthritis*, or Gout in general, and oftentimes also in the Gout of the Feet and Knees; and the sick person is first of all taken with an extream Chilness, and then presently a heat followeth upon it; and this is the Cause that the sick persons are so vexed and troubled with thirst, and that the pulse is changed, and that the Urines become very red, which oftentimes at the first beginning are waterish. But now what kinde of Feaver this is that accompanieth the Gout, in this many Authors differ, as below, in the *fourth Question*, we shall shew you. And sometimes there are likewise other Symptoms that follow upon the said pain; and among the rest, watchings, restlessness, and a *Spasm*. *Symptoms of the gout*

If the Gout continue long, and often afflict the sick party, then at the length there are generated in the joynts hard knots and knobs, from the more thick part of the serous or wheyish Humor, that even of its own accord tendeth to a Coagulation or Clotting together; and if the Skin be opened, out there runneth a matter, sometimes fluid and white, and sometimes like unto Playster or white Lime; and sometimes the matter is hard, like unto gravelly stones that may be crumbled.

This Malady is likewise known to disperse it self among the common People, the Cause being Generated from the general and common fault and vice either of the Air, or of the ordinary diet in many places. But now, whether it may at any time happen by Reason of any defect of that kind of fruit we call Mulberries, we shall further discuss this point anon, in the *fift Question*.

Chap. 2. *Of the Causes of the Gout.*

THe *Proxime* or nigheſt Cauſe of this pain in the Gout, is the Solution of Unity in the Membranous parts about the joynts: Now this solution proceedeth not (as *Capivaccius* wil have it) only from a Compression of the sensible parts about the joynt, caused by a preternatural repletion of the Ligaments with a Humor flowing thereto. For why, the Ligaments are most solid, and most thick, in so much that (in the first place) they themselves cannot admit of the Humors; and the pain is oftentimes in the highest degree, (when there is scarcely any swelling appearing,) and indeed far greater then that it should possibly be caused by compression only. This pain is therefore rather caused by the distention, and twinging, or pricking, in the sensible and tender parts about the Joynt. *The cause of the gout. Solution of unity in the Gout from whence it happeneth.*

But now, what the Cauſe of this diſtention, Pulling, and Pricking, is, cannot eaſily be explained, by reaſon of the difference in Opinions (among Phyſitians,) touching the ſame. For ſome there are that teach us how that the Gout is generated only from a diſtemper; others from a Winde; a third ſort, only from a Humor; and ſome of theſe will have this Humor to be flegm, others Choler, others Flegm with Choler; others aſſert it to be Flegm mingled with blood; others, Crude and Watery blood; others ſay that it is a whey; and others there are that admit of all theſe Humors. And indeed ſome affirm that this Humor floweth down from the Head, others again from the internal parts; others from the external parts between the Skul and the Skin; ſome again wil have it to flow forth of the Veins, and others by both theſe waies; touching which we intend to diſcourſe more at large, below, in the *ſeventh Queſtion*.

The neereſt cauſes of the gout

But in brief, that we may here in a word ſtate the Controverſie, the immediate and neereſt Cauſe of the Gout is a Humor, partly diſtending the parts of a quick ſenſe about the joynt, and partly pricking and lancing them, to wit, the ſerous or wheyiſh Humor, and yet ſuch as is not wateriſh, but Salt and ſharp, and (as the Chymiſts call it) Tartarous; bred in the ſanguification, in the Liver, and in the Spleen, and by Nature thruſt forth by the Veins and Arteries into the parts about the joynt. And indeed this Humor is altogether of a peculiar Nature, and much different from thoſe other Humors that breed an inflammation in other parts; and it hath its original from the ſame kind of Aliment that Plants draw from the Earth. For in all ſorts of Earth there is ſomthing that is ſaltiſh, and partaking of a Mineral Nature. Which whether we call it the Salt of the Earth, or elſe Tartar (with the common ſort of Chymiſts) it matters not with me, ſo that we agree in the thing it ſelf.

Whether the Salt of the Earth and Tartar differ.

And yet notwithſtanding it ſeems not al one to me, whether we call it the Salt of the Earth, or elſe Tartar. For Salt is indeed a ſimple Body of its own kind; but Tartar (as it is in truth taken here generally in this place by the Chymiſts) is a compound of Salt, and Earth, yea and of Sulphur likewiſe. From whence alſo it is that there are conſtituted Differences of ſuch like Earths; and ſo there ariſeth a diverſity of the Humor breeding the Gout in divers Bodies and places. And from either the abundance or ſcarcity of this Salt, and the mixture of it with other Juyces there ariſe various differences of Earths; ſo that ſome of them are dirty, others muddy, a third ſort Clayiſh, a fourth ſandy and Crumbling, a fifth Limye; and in ſome Earths there is an abundance of that we call Marle, in others Chalk, and in others there is ſomthing elſe that aboundeth: and in ſome Earths (in the which likewiſe Bread Corn grows very plentifully) there is ſo great a ſtore of this Salt, that even out of them there may be deſtilled a certain ſpirit that diſſolveth Metals. That Salt or Tartar is attracted from Plants (together with their Aliment) out of the Earth; and hence it is derived into men unto whom thoſe Plants ſerve for Meat and Drink: and unleſs it be ſevered and ſeparated in a Convenient manner, it is at length mingled together with the blood, and being altogether unfit for the nouriſhing of the Body it is in the end driven down and thruſt into the joynts, for thoſe Cauſes that we ſhal anon declare unto you. And this Salt Humor that cauſeth the Gout oftentimes cometh very neer unto the Nature of ſpirits (as the Chymiſts call them) ſuch as are thoſe of Wine, and other Vegetables, endued with a volatile Salt; as alſo of *Salt*, Vitriol, Nitre, and *Aqua Fortis*; which although that they are thin, Subtile, and Reſemble the Nature of Water, yet notwithſtanding they contain in them a moſt ſharp and biting Salt. And this Salt is contained as well in the Arteries, as in the Veins; from whence likewiſe it is, that being moſt ſubtile it exciteth very extream, intollerable, and moſt acute pains. For it is not requiſite, that thoſe Humors ſhould alwaies hurt the Body in a thick and groſs manner; but oftentimes they are made ſpiritual, as we ſhal afterwards alſo (in the Cauſes) ſhew you, touching Wine. And many things there are that teach us the truth of this. Firſt of all the very vehemency and fiercenſs of the pain it ſelf, which cannot poſſibly proceed from a Flegmatick or watry Humor, or elſe from Blood diſtending the parts; but from a very ſharp Humor, being oftentimes indeed but little in its quantity and bulk, but yet in power very great, and moſt efficacious. And moreover it appeareth from this, that at length there are generated in the Joynts certain hard knobs and knots; out of which there is taken, and goeth forth

forth a matter like unto Lime, such as also some certain Wines before they be wrackt and taken off their Lees do yield forth; which happeneth not at all in other Tumors, which are rather turned into *Pus*, then any such mattter as this; and therefore it sufficiently sheweth that the Gout hath some other peculiar cause, that the rest of the Tumors or swellings have not. And Thirdly, the Causes do argue and prove the same; since that there is nothing that maketh more for the generation of the Gout then Wine, which most of all aboundeth with such a Salt and Tartar as we mentioned before; there being no plant (as we shall also further shew you below) that doth more attract that that is Salt, Clayie, and Limye, in the Earth, then the Vine it self; although indeed other Plants likewise, (as Wheat and Barley) do draw unto them the very same matter as the Vine doth, but in nothing neer so great an abundance. Yea, and this matter is somtimes likewise conteined in the Water; and from hence it is, that now and then such as are Abstemious, or that otherwise by reason of their poverty they drink no Wine, but Water, are yet troubled with the Gout; and in some places we find that even Beer is exceeding hurtful unto those that are subject unto the Gout, whether this happen by Reason of the Corn there growing (of which they make their Beer) or from the Water they use for the same purpose.

And from hence it cometh to pass, that the Gout in very many places is a Disease almost Epidemical. And in those very places where the Gout is in a manner Epidemical (as it is in many places of *Moravia*) the inhabitants there, besides the Gout, are troubled likewise with the Stone, Colick, and that which ariseth from thence, the Palsie and contraction of the Members, and likewise the Falling-sickness; which affects (all or most of them) proceed not from the Watery Humor, but also from that which is sharp and Salt. And last of all, even this teacheth us that this Humor is serous or wheyish, that the Gout can by no means be drawn to a suppuration. For the blood is easily turned into *Pus*, and so are likewise the other Humors; but as for the serous and Salt Humors, this is the Nature of them, that if they be altogether thin, they are then wholly resolved; or if they have any thing that is Tartarous and thick mingled with them, they are then converted into hard knots, and smal Stones that are brittle and crumbling.

This matter, in regard that it cometh neerer unto the Nature of Minerals then of vegetables, it cannot therefore by any means afford a good and fit Aliment unto the Body; and so it ought either immediatly in the First, or else in the Second Concoction to be expelled; which when it happeneth, the Gout is not then generated. And from hence it is, that many Wine-bibbers, and Gluttons, are free from the Gout; which therefore happeneth, because that they have those their Bowels that are destined for Concoction very strong and vigorous; so that they do exactly separate all whatsoever is Excrementitious in those Meats and Drinks that they take in, and evacuate them by convenient waies. But if this matter be not forthwith evacuated, but be reteined stil in the Body, it is then thrust forward hither and thither in the Body, until it be at the length driven unto the Joynts.

Whether Choller, Flegm, or Melancholy, &c. be the cause of the gout.

And therefore without cause or ground it is (as anon in the 5. *Question* we shall more at large shew you) that by some Choler, Flegm, Melancholly, and Blood, are here accused. For possibly it may be that in one Body this Humor may abound and in another that Humor may be in great abundance, and may together flow unto the pained Joynt: yet nevertheless, that wheyish Humor (which Nature desireth to expel forth and therefore thrusts it forward unto the Joynts) is the first Cause of the motion; and then afterwards the pain likewise stirs up and causeth other humors to flow unto the place affected: and therefore if the Body be Plethorical, the blood; but if Cacochymical, then other Humors also are moved unto the place affected. Mean while, those very Humors are not the prime cause of the Gout; and if they had been altogether without that salt and serous Humor, it had never flown unto the joynts, since that there are many that are Plethorick and Cacochymick, who yet notwithstanding are not troubled with the Gout. And therefore what *Mercatus* writeth, is a truth, to wit, that although juyces or Humors may much abound in the Body, and become very vitious, they do not for this presently degenerate into the Articular affects, and produce the Gout: but that Humor which ought to produce the Gout (as we have already said) is

ferous, Salt, Sharp, and Tartarous; and hath a peculiar tendency unto the joynts.

what required unto every fluxion.

And now, whereas unto every fluxion there is required the matter flowing, the Term from which, and the place whitherto it tendeth, and the way by which; and that we have now already spoken unto the matter, the cause of the Gout; it remaineth that we proceed to speak of the Term from whence, (or the place in which the matter is generated) the way by which it floweth, and the term unto which it tendeth, or the part receiving.

The part receiving the fluxion in the gout

The weakness of the joynts how it concurreth unto the Gout.

And that we may first of all Treat of the part receiving, (that so we may afterwards Joyntly explain the Causes both internal and external: in the first place, the parts recipient are here the Joynts, (and those of the Feet especially, from which the Gout *Podagra* hath its original) as weaker then all the rest of the parts, in regard that they are endued with a weaker heat, consisting (as they do) of bones, ligaments, Cartilages, Tendons, Nerves and Membrans; and are further distant from the Fountain of heat; and are likewise greatly exposed unto the injuries of External Causes; and are also much weakned by labor and frequent exercises, and hereupon are rendered most apt and ready to receive the Humors that flow thereunto. And yet notwithstanding the alone imbecillity of the joynts is not sufficient for the generating of the Gout, but there is likewise altogether necessary the fluxion it self.

For (as *Galen* hath it in his *Sixth B. of the preservation of Health Chap.* 13.) they who Collect and Treasure up nothing within them that is superfluous, in them these weak and infirm parts remain still in safety. Of which this is one most evident Argument, that some have for many Months together been very weak and infirm in divers parts of their Body, without any such pain as the Gout bringeth along with it; whereas if weakness alone would cause it, the infirm part should perpetually be troubled, there being no Cessation at all of the Cause of its weakness and infirmity. And now therefore, because that it is not perpetually afflicted, (the Cause of its imbecillity being still continued) we may conclude, as a thing most manifest, that there is something else intervening, which is the Cause of the breeding of this affect; and this most certainly is nothing else, but that that is redundant either in quality or quantity. And yet notwithstanding, that the imbecillity of the parts is the necessary cause of the generating of the Gout, (as the most of the ablest Physitians do assert and determine) is denied by *Carolus Piso* (in his *B. touching Diseases from the affluence of the serous Humor, Consil.* 1. *of the Gout*) whilest he writeth, that Physitians oftentimes trouble themselves to no purpose, when they admonish us, that there is a very special regard to be had unto the weakness of the recipient parts, seeing that the Joynts do more easily and readily of their own accord receive and admit the hot Wheyish Humor, then the rest of the Members; this doth not (saith he) proceed from their imbecillity, or from any distemper, that is, loosness, or rarity, but from the very Conformation it self, and this not placed in the Cavity, but rather in the Conjunction with the ends of all the Vessels; which Conformation to alter and change is not at all within our power. And he hath there asserted, that the Joynts for this Reason only admit of and drink in the hot Wheyish Humor, because that in them are terminated the external branches of the internal Vessels. To wit, that the Ebullition or boyling out of this serous Humor doth first of all begin in the greater and the internal Vessels, and that from hence it falleth forth into the lesser, and at length into the extream branches, which having no other place whither they they may pour back the Humor they have received in, it is thereupon stopt and heaped up together in the joynts, in which the external Vessels (almost al of them) are terminated. All which although it may seem very agreeable unto the truth, yet notwithstanding two things there are that must here be taken notice of. The former is this, that although it be true, that those greater Trunks of the hollow Vein, and the Arteries, (their branches being dispersed hither and thither) are for the greatest part of them terminated in the joynts: yet Nevertheless there are likewise many of those branches which here and there are Terminated in the Flesh, and other parts, and yet for all that they Transfuse not the matter of the Gout into those parts. And moreover also the matter of the Gout is not alwaies poured forth

even

even unto the extream Joynts, but that it oftentimes alſo ſtops and ſtaies in the mid-way, in the Hip, Knees, and Elbows. The other thing to be taken notice of, is this, that albeit that Conformation of the Veſſels (by reaſon of which they are terminated into the Joynts) cannot be changed; yet notwithſtanding the Laxity and weakneſs of the parts into which they are ingrafted may in ſome meaſure be changed by thoſe medicaments that corroborate, although it be the leaſt part of the Cure (as hath been ſaid) that is to be expected from theſe.

why the humor that is the cauſe of the gout is moved unto the Joynts rather than to the other parts.

But beſides the imbecillity of the Joynts, there is yet ſomething elſe that ſeemeth to me to be the Cauſe why this humor is moved unto the Joynts rather than to any other parts; which conceit of mine I ſubmit (as a Paradox only) and leave it unto the free judgment of the Judicious and Candid Reader; and it is this. It is moſt certain, that the Blood in our Bodies is not altogether homogeneous, but obtaineth divers parts, and that divers parts of the Body are nouriſhed by thoſe different parts of the Blood; as the Fleſh by the more temperate, the Bones by the thicker, the Lungs by the more ſubtile, and ſo likewiſe the reſt of the parts attract unto themſelves from the blood a fit and convenient Nutriment. And this ſeemeth alſo to be proved by the ſtone called *Oſteocolla* (ſo called becauſe that it hath in it a notable virtue of Conglutinating the broken Bones) which being taken inwardly penetrateth into the Bones, rather than into any other parts, and cauſeth that the *Calli* are generated in a very ſhort time; yea, in thoſe that are yong it produceth an overgreat *Callus*; as we may ſee in *Guilhelm. Fabricius* his firſt Century, *Obſervat.* 90. & 91. Neither are theſe things done in a ſound Body only; but even the vitious humors likewiſe have not an inclination al of them, neither are they al driven unto any one part; but ſome of them tend unto one part, and others of them unto other parts; and this we are taught, as by other diſeaſes, ſo more eſpecially by the *Plica Polonica* above mentioned. And therefore ſeeing that *Herculeſ Saxonia* in his Book of the *Plica*, Chap. 26. writeth nothing but the truth, when he ſaith that the humor (the Cauſe of the *Plica*) hath a propriety not wel agreeing with the Joynts, Ligaments, Tendons, Nerves, and al the Membranes; but a certain familiarity with the Hairs and the extream part of the skin: I conceive that I may alſo as rightly Aſſert that the Humor the Cauſe of the Gout hath a certain kind of familiarity and natural alliance with the Bones; but that it is an Enemy unto the Membranous parts, if not in an occult manner, yet certainly by its Acrimony, and by its twinging and lancing faculty. For very probable it is, ſeeing that the Bones as alſo the Ligaments and tendons, are nouriſhed by a Blood that is more Earthy, as having an alliance with the Tartarous humor; that other Tartarous humors alſo (as wel the thick, as the ſubtile) are thruſt forth more unto the Joynts than unto any other parts; and more eſpecially unto the Joynts of extream parts, ſince that Nature (as much as poſſibly ſhe can) is wont to thruſt forth the vitious humors from the principal places unto the moſt remore parts. For although it be ſo ſomtimes that Nature doth not preſently thruſt forth into the extream Joynts of the Feet or the Hands the matter that is the Cauſe of the Gout, but that it ſtops and ſtaies in the mid'ſt of ſome Joynt; yet notwithſtanding afterwards when the pains begin Nature (if ſhe be yet any thing ſtrong) driveth back again into the greater Veins the Matter by the ſame waies by which it flowed in; and from hence ſhe thruſts it forward even unto the extream Joynts: touching which, as alſo whether there lie any thing hid in the very Bones themſelves that may make for the exciting of the Arthritick Paroxyſm, we ſhal ſpeak more hereafter in the eighth Queſtion.

whether the Gout be generated by a collection of the humors.

Secondly, As touching theſe humors (that are the Cauſe of the Gout) where they are Generated, and by what waies they paſs into the Joynts, the Opinions of Phyſitians are various and different; of which we ſhal ſpeak further in the ſeventh Queſtion. But now that I may in few words comprize the ſum and ſubſtance of the thing in queſtion; ſeeing that al ſwellings, and the preternatural Collection of humors in any part, is done two waies; to wit, either by Congeſtion by which the humor is by little and little collected and heaped up in the part, or elſe by Afflux; we cannot conceive that the former of theſe waies hath any place in the Gout. For if by Congeſtion and the alone weakneſs of the parts the humor ſhould be collected in the Joynts, then the pain and ſwelling could not be bred ſo ſuddenly, ſo eaſily, and ſo evidently; and the infirm part ſhould perpetually labor and ſuffer, in regard that the Cauſe of this diſtemper and pain ſhould never be abſent from it. But now, ſince that Perſons that have the Gout are not in a continual ſuffering condition, but that ſome of them are free for ſix months together, and that afterward the matter again floweth unto the Joynts, and that indeed ſuddenly, to wit, when there is a vitious humor collected in the Body, which urgeth and provoketh Nature unto the expulſion thereof: it eaſily from hence

appeareth

appeareth that the Gout is not generated by the collection of humors, that is not done but by degrees, now a little, and then a little. And therefore the most learned *Solenander* writeth truly in his *fourth Sect. Consil.* 24 *The humor* (saith he) *which is by little and little collected by the vice and fault of the particle of Nouriſhing, if at any time it could excite pain, and hinder the Motion, yet notwithſtanding there was never yet any Phyſitian that ever told us that it could excite the Diſeaſe we call the Gout.* But this notwithſtanding in the mean time I deny not, that in thoſe who are ſcarcely ever wel in their Feet or other Joynts, the imbecillity and weakneſs of the Joynts may poſſibly conduce very much unto the long laſting and continuation of the Malady. For the part that is infirm and weak doth not rightly aſſimilate the Aliment unto it ſelf, but collecteth the excrements, and thereupon it likewiſe the more eaſily receiveth the humors flowing unto it, and the more difficultly ſcattereth them when they are gotten together.

The long continuance of the Gout from whence it is.

Felix Platerus indeed maketh mention of a certain peculiar kind of Gout; ſuch almoſt as we ſhal likewiſe make mention of a little below (in the *Sixth Queſtion*) out of *Eraſtus*; which is excited, not by the matter that floweth from elſewhere, but from the excrement that is heaped up together from the Blood about the Region of the Joynts, the place affected being extreamly weakned from the many fluxions, and there heaping together new excrements, and cauſing a pain that is not very grievous or intollerable, which produceth a moiſt and watry kind of ſwelling rather than any other; and he aſſerts it for a moſt certain truth, that thoſe who are thus affected are very ſeldom or never free from the Gout; and ſomtimes by reaſon of the affluence of the humor, and ſomtimes again by the congeſtion and heaping of it up; from the one or the other of theſe Cauſes they alwaies carry about with them certain ſigns and tokens of the ſame, and are continually ſuffering ſomthing or other by reaſon of it.

Peculiar kinds of the Gout.

But the truth is, this is no peculiar kind of the Gout; and if ſo be that it differ from the Gout which we have deſcribed, it is not then the Gout, but rather a moiſt and watry ſwelling in the Feet. And hence it is that *Platerus* himſelf confeſſeth that it very ſeldom or never firſt beginneth of it ſelf, but that it is wont to follow ſome other that was cauſed from afluxion. To wit, by pain, and the long continued and frequent afflux of the humors the Joynts are ſo weakned, that they cannot rightly concoct the Aliment that floweth unto them; much leſs aſſimilate the ſame unto themſelves; and hence it is that there are many Excrements collected; and theſe being heaped up do excite that moiſt and watry ſwelling without any grievous pain: which ſwelling notwithſtanding (if the pain proper unto the Gout be not preſent with it) is not properly the Gout. But if the true *Arthritis* or Gout be joyned together with it, the debilitated part cannot then without much difficulty, and long time, diſcuſs and ſcatter the humor that hath flown unto it; and hereupon it hapenneth that before one humor be diſperſed (which as *Hippocrates* writeth, is ſeldom or never before the fortieth day) another humor floweth unto it, and to the ſick Perſon may ſeem continually as it were to be afflicted with the Gout; or likewiſe, if the Afflux be but by ſhort intervals, he is in very deed perpetually troubled therewith.

But now, in what manner, and from whence this afflux proceedeth, here likewiſe Authors ſeem to differ much among themſelves. But if waving and laying aſide Authority, we heedfully attend and obſerve the thing it ſelf, and thoſe things that are done about the ſick perſon, we ſhal eaſily perceive that this Afflux is by the Veins and Arteries. For in ſuch as are troubled with the Gout (upon the very firſt approach of the Paroxyſm) the Veſſels that tend unto the Hands and the Feet, and are inſerted into the extream Joynts, are wont manifeſtly to ſwel. And then again, this Diſeaſe doth ſuddenly invade, and the afflux is wont to be very ſudden, which cannot happen but only by the Veins and Arteries. And moreover, it eaſily paſſeth out of one place into another, eſpecially if cooling and repelling Medicaments be applied unto the part affected; and that pain that but even now afflicted the Foot, this Foot is no ſooner freed therefrom, but it preſently beginneth to afflict the other Foot, or the hand. Or, if Nature lie under the burden, and be not able to expel thoſe vitious Humors (theſe ſticking faſt about the Bowels, and eſpecially about the Heart) there are then excited ſtreightnings of the Heart, and faintings, with ſwounding fits (as I have oftentimes obſerved) which ceaſe not until that the vitious Humor be again driven out into another Joynt: which motion of the humor cannot be but by the common Veſſels. And furthermore, Feavers (as wel continual as intermitting) are ſomtimes terminated into the Gout; which could not be, unleſs the matter were in the Veins. And laſtly, a Feaver is wont to happen, and a change in the Pulſe, which ſheweth that the Humor is contained in the Veins and Arteries.

From whence the Afflux proceedeth.

How and from whence the Afflux is in the Gout.

And

And therefore ſeeing that this Humor (the cauſe of the Gout) is contained within the Veins and Arteries, and out of them poured forth into the Joynts; without doubt it muſt of neceſſity be generated in ſome Concoction of the Blood, and indeed ſuch a Concoction as out of which the Veins and Arteries receive that Humor which they contain: and this we determine to be in the Liver and Spleen, the Sanguification being there hurt in its own manner. *where the Humor, the cauſe of the gout, is generated.*

But now, the Cauſes (by reaſon of which this humor is generated) are two: The former whereof is ſomthing amiſs in the Liver and Spleen, and more eſpecially the exceſſive heat and drineſs of thoſe parts; and then the other cauſe thereof (this being indeed the chief and principal) is ſuch a kind of Aliment from Meats and Drink as maketh a continual ſupply of ſuch a like Tartarous matter. *For what cauſes it is generated.*

As for the firſt of theſe, The Stomach may indeed likewiſe confer ſomwhat hereunto, if in it the Chyle be not rightly elaborated; and if that after this Concoction the Tartarous feces or dregs be not moſt of them inſtantly ſeparated: and hence it is alſo that al Phyſitians warn us in the preventing of the Gout, to have a ſpecial regard unto the firſt Concoction: and yet notwithſtanding that hurt Concoction of the ſtomach doth not moſt immediately conduce unto the generating of the Gout, but that there is a neceſſity that the Concoction in the Liver and Spleen ſhould likewiſe be hurt. For if there be any thing amiſs in theſe (which cannot indeed very eaſily and determinately be demonſtrated and made to appear) it then cometh to paſs that the unuſeful parts, ſalt and tartarous (which are in the Chyle) cannot be rightly ſeparated, but remain mingled with the blood, and together with it are derived unto the Veins. And by reaſon of this Vice and fault of theſe Bowels it happeneth that oftentimes from Meats and Drinks in themſelves not very hurtful ſome perſons are very eaſily offended; and on the contrary, others that have ſtrong Bowels (in whom the Concoction of the blood, and the ſeparation of the excrements is rightly performed) although they uſually feed upon meats apt to breed the Gout, and fil themſelves alſo with Wine (and that likewiſe none of the wholſomeſt) they are not yet for al this at al troubled with the Gout.

But what this diſtemper of the Liver and Spleen is, cannot ſo eaſily be explained and unfolded. And yet nevertheleſs, if any one ſhal determine it to be a hot and dry diſtemper, I ſhal not at al gain-ſay him. But in what manner this hot and dry diſtemper doth effect what hath been ſaid, this is not ſo cleer. *Franciſcus Valleſius* tels us for a truth, That by this diſtemper there is ſtrongly preſſed forth a water from the reſt of the Juyces; which is not probable, unleſs it be fitly explained. For this we willingly grant, That if the Liver be more hot and dry than what naturally it ſhould be, inſtead then of a moderate Elixation or boyling there wil be a certain Aſſation or roſting; and ſo the blood that is generated muſt needs be ſharp. Others affirm (and indeed not unfitly) that the Liver and Spleen when they are vehemently and intemperately hot, attract the ſerous and ſalt Juyce in the Food, which ought to have been ſeparated and evacuated in the firſt Concoction, and ſo it comes to be mingled together with the blood. Yea, and haply alſo in the diſtempered Liver it ſelf and Spleen the Blood is not wel elaborated; and ſomthing there is left remaining therein that ought by right to have been ſeparated, which being afterwards heaped up in the Veins is the cauſe of the Gout. *what kind of diſtemper it is that maketh for the gout.*

And I am of Opinion that the very ſame happeneth in the Liver and Spleen, that happeneth in the Reins. For many there are that eat Cheeſe and other meats that are very apt to breed the Stone, and yet notwithſtanding they do not generate the ſame; whereas others on the contrary, in whoſe Reins there is a ſandy, gravelly, and ſtony conſtitution (as *Fernelius* calleth it) or a power in the Reins of breeding the ſtone, theſe are eaſily offended by the meats aforeſaid. And I conceive that the caſe is the ſame in the Gout; and that there is a certain vitious conſtitution in the Bowels of thoſe that are troubled with the Gout; and I am of Opinion that this vitious Conſtitution is the efficient cauſe of that Salt, or Tartar, by reaſon of which that Humor which is the cauſe of the Gout is produced, which when it once cometh to abound, it is then afterwards thruſt forth unto the Joynts. And this vitious conſtitution is communicated unto ſome from their Parents; and by others it is contracted from the uſe of Meat and Drink of a like Nature, and likewiſe from the Errors they commit in the whol courſe of their Dyet.

And moreover, Although the faculty of the Bowels be wel conſtituted; yet if the Meat and Drink abound with ſuch a like Tartarous matter, it cannot al of it be evacuated by Nature, in regard that neither in the firſt Concoction, nor yet in the ſecond, it cannot be ſeparated as it ought to be, but remains ſtil mingled with the Blood. But yet in the mean time

Cau

(as much as may be) it is altered by Nature, and by her spiritualized also (if I may so speak) or as *Mercatus* speaketh, it is attenuated, poured abroad, and changed into a thin, spiritful, and sharp humor, which is afterwards by Nature thrust unto the Joynts. For the Joynts (as I said before) are parts that are weak, and extream, bony, and bloodless, unto which Nature is wont to thrust not only the serous Humors, but whatsoever likewise hath any alliance at al with the Humor that floweth. But now the imbecility of the Joynts is either Native or acquired. It may then be said to be Native, when either the Joynts themselves in their first structure are more loose, softer, and more apt to receive the Humors flowing unto them; or else when they have either from the Parents, or from the Grand Parents thus affected, by a right of Inheritance (as it were) contracted this distemper and weakness. But it may then be said to be acquired, when the Joynts are weakned either by overmuch labor, excess and injuries of the Air, or other Causes altering the Joynts.

The weakness of the Joynts twofold.

Why the Humor is moved to the joynts.

But now, that the Humor which is heaped up in the Veins, and about the Bowels, should be moved unto the Joynts, this cometh to pass, Because that Nature being stirred up and forced by the abundance of vitious humors, attempteth the expulsion of them. And yet if any thing happen that may move the humors, the Paroxysm is then more easily excited. And this cometh to pass if any one be provoked to wrath, or stricken with terror, or any other vehement affect of the mind, or if any shal be very hot, and then suddenly cool again on one and the same day, or else shal exercise himself immoderately, or make use of the Bath unseasonably. And this is likewise done by the retention of the usual and accustomed sweat, or the excess in qualities of the Ambient Air, and the change thereof; and more especially that change that is made at certain times of the Year: and it is manifest by Experience, that about the beginning of the Spring, and Autumn, the Blood is moved and stirred up and down in the Body; and if there be any thing faulty in it, Nature is wont to expel it unto the more ignoble parts; from whence arise scabbiness, the *Erysipelas*, Feavers, Gouts, and many other Diseases, according to the various disposition of bodies.

The Antecedent causes.

From al which it is easie to find out the Antecedent, Procatarctick, and altogether remote Causes, as also the external and internal Causes; which (of what kind soever they be) either they make for the generating of the matter and humor producing the Gout; or else they weaken the joynts; or else lastly, they so cause it that the humors are moved and excited.

But since that these are various, and that some of them do concur more waies for the generating of the Gout than others, they may therefore be considered according to those things we cal Things not Natural.

Air.

And first of al, As for the Air, We have already said that in the Spring time the Gout is most chiefly excited; and then again in the Autumn, by reason of the motion and change of the Humors that happeneth at that time. And the truth is, the Gout is wont in the Spring time most especially to infest the party, because that the humors that have been al the Winter long heaping up, are wont then to be poured abroad, and moved up and down, as *Lucian* telleth us in most elegant Verses making a description thereof, in his *Tragopodagra*.

And the very same may likewise be sometimes effected by other distempers of the Air: and like as the moist Constitution of the Air doth otherwise produce Catarrhs and Fluxes; so it likewise oftentimes causeth the Gout. And without doubt that Epidemical Gout (of which out of *Athenæus* we shal anon in the fist Question make mention) was at first produced by some peculiar Constitution of the Air.

And moreover, the Course of Dyet that is observed doth make very much for the generating of the Gout; and especially the drinking of strong Wines, by which alone many have attracted the Gout unto themselves; as *Quintus Serenus* writeth of *Ennius*.

And indeed there is no one thing that is more offensive and hurtful unto persons that are troubled with the Gout than the drinking of Wine, as we find it to be true by common experience. For there is nothing that obtaineth more of that Tartarous matter (or call it what you please) that is so apt and fit to generate the Gout than Wine.

Which matter although (as we said a little before) it may in some stronger bodies be separated; yet nevertheless, those that find themselves subject to the Gout, having but weak and infirm bowels, have no reason (after the example of other insatiable Wine-drinkers) to indulge themselves any liberty in the drinking of Wine; but it is far more fit for them to abstain from it. And so on the contrary, many have been freed from the Gout by their abstaining from Wine. And *Trincavel* (in his twelfth Book, and second Chapter, of the way of Curing the several parts of Mans Body) writeth that he knew a very aged Physitian at *Venice*, who having been exceedingly troubled with the Gout al his life long, even unto his old

The gout cured by abstinence from Wine.

Age,

Age, at length by abstaining from Wine for five yeers only, he came to be so freed from all those troublesom and painful fits that attend the Gout, that he was ever after (even to the very last of his old Age, and to the hour of his death) altogether freed from these pains. And *Franciscus Alexander* (in *Descriptione Diacorallii*) writeth likewise that one *Francis Pechius*, a man fifty yeers of age, and troubled with the Gout, was cast into Prison by a certain Marquess, and there kept twenty yeers; and that he was ever after this freed from the Gout. And *Solenander* also (in his 5. *Sect. Consil.* 1.) relateth of a certain Widdow, a Spaniard born, that having omitted and left off the use of Wine (which yet notwithstanding she had but very sparingly made use of after the custom of her Country, and alwaies diluting it with Water) she was never more after that troubled with the Gout. And there are many other such like known Histories of them that have either been cast into Prison, or else have been reduced unto poverty, and so have of necessity abstained from Wine, and thereby been freed from the Gout. To wit, whereas the next and most immediate Cause of the Gout (as we likewise told ye before) is some certain thing that hath as it were the Nature of a Mineral, and this altogether unfit for the nourishing of the body (such like as is to be found in al kind of Earths, but yet in some more, in some less) the Vine attracteth it more powerfully than other Plants (and that this is so, appeareth even from that Tartar which is to be found more abundantly in the Vine than in any other Plant, and in that Vines wil grow and thrive in those places wherein other Plants wil not prosper, as not having aliment enough; the Vines contenting themselves in a manner only with that very salt of the Earth) which afterward together with the Wine (although variously changed) is derived into Mans body, and being there heaped up it affordeth matter unto the Gout.

And yet notwithstanding there are likewise some kind of Meats and Drinks that make very much for the breeding of the Gout; and there are sometimes Waters to be found that generate the Gout; and in those places where the Gout is Epidemical not only the rich that drink Wine, but the poor also that drink Water, are afflicted with the Gout. And so likewise *Julius Alexandrinus* writeth (in his fifteenth Book of things that are wholsom, and sixt chapter) that he knew a certain person troubled with the Gout; in whom by the eating of Carps and Breams the Gout was perpetually bred. So that he could when he listed by this means bring the Gout upon himself. And moreover, Wines they are not al of them of one and the same kind. For some of them proceed from a sandy Earth, and contain less of this Tartarous matter. And such are those Wines that grow at *Jassen* (a Town hard by) called *Gorubergensian* Wines; which although that they be drunk in great abundance by the Inhabitants of that place, yet I never heard of any of them that was there troubled with the Gout. And such Wines as these are likewise to be found in many other places. But on the contrary, those Wines that grow in an Earth that is fat, muddy, clayish, stony, and that hath in it a Mineral Marl, gravel, stones, or any thing else that is Mineral mingled with it, are very apt and ready to generate the Gout; and such are the Wines of *Moravia*, *Bohemia*, *Hungary*, and most of the Wines of *Austria*. And although that the Wines that do not generate the Gout leave oftentimes in the Vessel more Tartar than those Wines that do indeed produce the Gout; yea, and if they be distilled, there is likewise more of the said Tartar found in them than there is in these (like as at *Vratislavia*) as that eminent and famous Physitian Doctor *Doringius* wrote unto me, of twenty four measures of Renish Wine there were found almost three ounces of Tartar; whereas in the distillation of as many Measures of the *Tocavian* Wine, that is accounted the strongest of al the *Hungarian* Wines, there were scarcely two drams of Tartar to be found, yet nevertheless al this maketh nothing against what we have said. For those Wines have that Salt or Tartar superficially only (as I may so say) and in a thick manner mingled together with them; or (that I may speak with the Chymists) they have the Salt as yet fixed; but these have a volatile Salt or Tartar most exactly mingled with them, insomuch that this Salt and Tartar is in a manner made spiritual; whereupon it is, that the former of these is more eafily separated either in the Stomach, or in the Liver, and so is thrust forth either by the belly with the rest of the excrements, or else it is voided by Urine; but this other being mingled with the spirit of the Wine passeth into the very Mass of the blood, and so penetrateth into the most inward parts of the body. And that those Salts that were fixed may be made Volatile, the Distillations of Chymists do sufficiently prove; and that the Tartar may be made as it were Spiritual, and elevated by the Alembick, this we are taught by the Tartarized Spirit of Wine: yea, and Metals may also be so dissolved in strong Waters and Spirits, that they may not only be strained through paper, but that they may likewise be elevated into the Alembick: But yet never-

The gout caused by the eating of Carps.

wholsom Wines.

Wines unwholsom.

 theless,

theleſs, in regard that this Salt although it be ſubtile, is altogether unfit for the nouriſhing of the body, as partaking of a Mineral Nature (which is not fit for the nouriſhment of living Creatures) albeit it doth together with the blood penetrate into the Veins; yet notwithſtanding as ſuperfluous and uſeleſs it is at length by Nature caſt forth of the Veins and Arteries, and thruſt out unto the Joynts. And therefore, whether or no Wine be apt to generate and cauſe the Gout, we are in the firſt place to judg of this by the place where it groweth, and its effect; and then next of al by the ſtrength therof. For by how much the ſtronger Wines are, by ſo much the more exactly and ſubtilly is this Salt mingled with them, and becometh more ſpiritual: like as it appeareth in the Spirit of Wine that is Tartarizated, which is more ſtrong than the ſimple Spirit of Wine.

All which notwithſtanding is thus to be taken, if by reaſon of the diſtemper and weakneſs of the Bowels (as we alſo ſaid before) that which in the Wine is Excrementitious and Tartarous, may not be ſeparated. For if it may be ſeparated, the Wine wil then be wholſom, and without any hurt in it. Yea, and if any ſuch Wine could be had that having but little of ſuch a like Tartarous matter in it ſhould yet ſtrengthen the weak Bowels that do not wel ſeparate theſe Excrements, and ſo ſhal help the Concoction and promote the ſeparation and evacuation of the Excrements, we grant that this would prove to be not only harmleſs, but likewiſe very uſeful and profitable if moderately drunk. And ſome tel us that the *Pucine* Wine is ſuch, and therefore they commend it for the prevention of the Gout. But I much doubt, whether this Wine be in al reſpects anſwerable unto what hath been ſaid; and therefore I conceive that it is good firſt to make trial, and to conſult with Experience.

Wine, how it doth generate the gout.

We have indeed above ſpoken ſomthing as touching the cauſe for which certain Wines breed and cauſe the Gout: but yet nevertheleſs, my deſire and purpoſe is here to explain the thing, and ſo to make the matter ſomwhat more cleerly to appear. I think it to be a very plain and cleer truth, that Wine produceth the Gout, not as it is Wine, but as it containeth in it ſomthing that is unfit, and ſomthing likewiſe that is extraneous, and unuſeful unto our bodies, which is therefore by Nature thruſt forth unto the Joynts. And this appeareth if by nothing elſe, yet by this, That there are ſome certain Wines that do not generate the Gout; and ſuch are our *Gorubergenſian* Wines, and many others alſo, that here in theſe Regions grow in Sandy places. For albeit theſe Wines be drunk for a dayly and ordinary drink, and that not ſcantly, but very plentifully; yet there was never any that from hence contracted the Gout. But on the contrary, the *Moravian*, *Bohemian*, *Auſtrian*, *Hungarian*, and likewiſe very many more Wines of other Regions, are moſt apt to breed the Gout. Yea, and not only the Wines, but even the Waters of ſome places, do generate the Gout. And ſo it was related unto me by that eminent Phyſitian, *Dn. D. Tobias Knoblochius*, that at *Iglavia* in *Moravia* (where he had practiſed Phyſick there for ſome yeers) that not only the Wealthier ſort of People that drank Wine, but even the poor who hardly ever taſted a Cup of Wine, were al of them very ſubject unto the Gout, Colick, and Fallingſickneſs, Diſeaſes Epidemical in that place.

In certain places waters alſo generate the gout.

What that is that maketh that certain wines are apt to breed the gout.

But now, Inquiry is to be made, What that ſhould be which maketh that certain Wines are apt to generate the Gout. Where we are firſt of al to take notice, that nothing doth nouriſh (touching which we have ſpoken elſwhere) but what proceedeth from things animated, or enlivened. And therefore al other things, as Minerals, Metals, and divers kinds of Earths, are unapt to nouriſh our bodies; and thereupon if they be at any time taken in, they are again to be evacuated either by the Urine, or elſe by the belly; and this if it be not done, they are then by Nature thruſt into the Joynts, and ſo they there generate the Gout. And therefore thoſe Vines that grow in a ſandy Earth, that is not at al fat and rank, have nothing that they may attract and draw unto them, beſides the Alimentary Juyce: but thoſe that grow in Clayiſh grounds, or any other fat Earths, do not attract unto themſelves only a vegetable juyce, but alſo a Mineral juyce as it were, and ſuch as is wholly unuſeful for our bodies, which is not unfitly termed Tartar, a ſubſtance, to wit, that conſiſteth of a fixed and volatile Salt, and of an Earthy and almoſt Mineral matter; ſuch as not only ſticketh faſt unto the ſides of Caſks, but is likewiſe throughly mingled with the ſubſtance of the Wine. And this is altogether the Nature of Salts, that they reduce other bodies into the ſmalleſt Atomes, and then do aſſociate the Atomes unto themſelves. We may ſee an Experiment of this in the diſſolving of Metals in ſtrong Waters, in which the Metals (bodies otherwiſe thick) are ſo united unto the ſalt of the Waters that diſſolve them, that they may paſs through a Card or Paper. And the very ſame we likewiſe ſee in the diſſolving of Pearls, Margarites, Corals, and Crabs Eyes, which ſticking faſt unto the Salt of the Vinegar, are throughly mingled

with

with the Water, and may be strained through a Card; but being precipitated they will dissolve no further. We have likewise an Example hereof in Vitriol, which being dissolved in Water may likewise be strained through a Card: but when the vitriol is Calcined, and the Salt drawn forth of it, there remaineth an Earth that is not dissolveable by any liquor whatsoever. And so in hot Baths of Water there is an Earthy substance so exactly mingled therewithal, that it cannot possibly be discovered by any sense. But yet when this afterwards shall stick fast unto the wooden and stony pipes, and shal subsist apart by it self, it is not then any further to be dissolved in Water. From all which it appeareth that the Gout is not generated without Salt; and without doubt the sharpest and most extream pains in the Gout are from Salt: but yet we say not that Salt alone, pure Salt doth this; since that there are Wines in many Regions that have Salt also, and yet for all that they do not generate the Gout; but there concurreth moreover a matter that is Clayish, Limy, Marly, or some Mineral which the Vine had attracted out of the ground, together with the nourishment, concocted it, and mingled it with the Alimentary matter and so communicated it unto the Grapes; and hence the Wine also that is presled forth of the Graps receiveth and retaineth it. And hereupon it is that we see, how that in the Joynts of such as are troubled with the Gout there are sometimes generated hard knobs and knots, and that there is as it were Lime taken forth of them; which indeed is nothing else but that same Mineral Matter which the Salt of the Wine drew along with it, and which at the length (as altogether unuseful and unfit for the nourishment of the Body) is thrust forth unto the Joynts. Now therefore (that we may come unto the Question, why some Wines do generate the Gout, and others do not so) the more any Wine hath of this matter, and this throughly mingled with it by the smallest Atomes, by so much the more powerful it is for the generating of the Gout. Which cometh to pass, in the first place, by Reason of the soyl, to wit, where the Wines grow, whether in a Muddy ground, or that that is Clayish, Limy, Marly, or any other Mineral Earth. And furthermore in the Second place, if the Wines shall not be wholly purifyed and freed from their Tartar, but still remain as it were thick and turbid; and this happeneth first of al in Wines that are new, and not yet wrackt by turning them from Vessel to Vessel; and then Secondly in some certain Wines that wil never be altogether cleer; such as are those of *Hungaria*, &c. And Thirdly, if that Tartarous matter be so throughly mingled with the Wine in the smallest Atomes, that it cannot be separated from our bodies, neither in the first, nor yet in the second Concoction; which for the most part happeneth in Generous and strong Wines, and such as grow in places hotter then ordinary. For Wines that are not strong and generous, although that even these may contain in them some of the said Tartarous matter: yet notwithstanding, in regard that the heat of the Country was not so powerful that it was able (either in the Vine, or in the Grapes,) to mingle this Tartarous matter with the Spirit that is in the Wine, it is thereupon also afterwards (either in the first, or in the second Concoction) more easily separated, and driven forth either by the Belly, or by Urine.

what wines they are that do more generate the gout, and what, less.

But if by the Air of a hotter Country, that doth concoct more powerfully, that same Tartarous matter be exactly mingled together with the Salt and spirit of the Wine, it then refuseth to be severed by the separating faculty, and so penetrateth it self into the whole Body with the Alimentary part. But yet because that it is altogether unfit to nourish the Body, it is at length by Nature thrust forth unto the Joynts, and there it generateth the Gout. And that this is so, we are taught by the experience we have even of the *Hungarian* Wines. For although (as experience it self testifyeth) they be most apt of themselves to generate the Gout; yet (as we told you a little before) it is observed in the destillation of the *Hungarian*, and *Renish* Wine, that there was more of the Tartarous matter collected out of the *Renish* then out of the *Hungarian*. Which happeneth for no other cause but this, to wit, that in the Wines of *Hungary* that Tartarous matter is by the smallest Atomes so exactly mingled with the spirit of the Wine, that together with the said spirit it may likewise pass through by the Alembick.

Carolus Piso, amongst those Causes from which the matter of the Gout is heaped up in the Veins, putteth likewise moist and wateriſh meats for one, as broths, raw fruits, and the like. But he doth this upon a false *Hypothesis* or Supposition, whilest he mistakingly determineth that the *Serum* or whey is a meer and pure Water;

whether meats that are moist and wateriſh do breed the gout.

water; whereas yet notwithstanding Experience it self teacheth us the contrary; and there was never any man yet known to get the Gout from the alone use of moist and watry meats, neither indeed can wateriſh humors possibly excite such great and so sharp intollerable Pains.

The suppression of the wonted Evacuations.

That which likewise maketh very much for the generating of the Gout is the suppression of the wonted evacuations. And hence it is that *Hippocrates* (in the sixth of his *Aphor.* *Aphor.* 29.) writeth, that Women are never troubled with the Gout but when their Courses fail them; of which notwithstanding we intend to speak more hereafter in the ninth Question. And so the same *Hippocrates* writeth (*Epid. 6. Sect. 8. text. 55.*) *that at* Abdera, Phaetusa *the Wife of* Pithous *having been before (while she was yong) very fruitful in bearing Children, upon a very long absence of her Husband from her her Monthly Courses left her, whereupon afterwards pains and rednesses arose about the Joynts. And the very same (saith he) happened also unto* Thaso *the Wife of* Namysias Gorgippus. And from hence likewise it is, that oftentimes those Persons are wont to fal into the Gout who have had old Ulcers in their Legs, or Fistulaes in the Arse suddenly consolidated or healed up, and the Fluxes likewise of other places wholly suppressed. For those humors that are wont to excite those long lasting Ulcers of the Legs, and Fistulaes of the Arse, are themselves also salt; and therefore if they be suppressed, they may produce the Gout.

whether every Error in things not Natural may produce the gout?

And here there are very many that are wont to be long and tedious in the recital of the Causes (external and internal), who wil not pass over in silence any one of those things we cal not Natural. But although that every Error whatsoever in the use of the things not Natural may produce a Cacochymy; yet we deny that every Cacochymy hath in it a sufficient power to produce the Gout. And of the rest of those things that are not natural, there is hardly any of them that of it self doth produce the Gout; but only that by overmuch motion, Anger, and Fear, the Paroxysm is excited; and the retention of the sweats doth also make very much for the producing of the same; and if the Person hath been long accustomed unto those sweats, the retention and suppression of them is an Argument that the Gout is very neer at hand. But yet we grant that excessive Venery doth make very much for the generating of the Gout, by weakning not only the Joynts and Nervous parts, but also the whol Body: and hence it is that by the Poets the Gout is said to be the Daughter of *Bacchus* and *Venus*.

Venery one great cause of the gout.

The gout sometimes Hereditary

The Gout is somtimes likewise hereditary; and a weakness not only of the Joynts, but of the Bowels also breeding the vitious humors, is from the Parents and Ancestors communicated to their Children and Nephews; whether this happen from the vitious seed; or else that the matter of the Blood in Persons troubled with the Gout is subject and enclined thereunto, from whence the vital spirits are generated, and all the parts do receive their nourishment. And yet notwithstanding it may so come to pass that Parents that are themselves affected with the Gout may yet beget Children not subject thereunto; and yet their Nephews may notwithstanding at the length be troubled therewith. And indeed there are some of this Opinion that those Children that are conceived in the very Paroxysm of the Gout, these shal likewise be born thereunto; whereas on the contrary, such as are conceived out of the fit of the Gout, these shal be safe and secure. But very few perhaps there are that beget Children in the very Paroxysm of the Gout: like as we see also that Epileptick Persons may out of their Fit beget Epileptick Children. For the truth is, it is not so that the very matter it self that exciteth the Paroxysm is imparted unto the Children; but only a vitious disposition thereunto, which alone is not sufficient for the producing of the Gout; but that there is required likewise an Afflux of vitious humors. And therefore if those Children shal observe an exact and careful Diet, it may then so come to pass, that the weakness which they contracted from their Parents may be abolished, or else it may be corrected; and humors fit for the breeding of the Gout may not be generated in the Body. And on the contrary, it may so happen that albeit the Child may not be troubled with the Gout, yet nevertheless the Nephew may be affected therewithall, to wit, if he augment by errors in the Course of his Dyet that vice and weakness that was communicated from the Grand-Father by the Father; and so that vitious disposition that was wel neer suppressed and might have been wholly abolished had he but used a good dyet, is now again by the Errors of his Dyet (as it were) renewed and revived. Unto which we may likewise add this, that the vice that is in the Fathers seed may somtimes be corrected and amended by the goodness of the Mothers Milk. And moreover these Morbifick seeds may likewise have their own times, in which they do at length discover themselves (like as we see it to be in Intoxications, and the poyson of a mad Dog) or else haply they altogether lose their strength, and so they quite vanish.

whether Children begotten out of the Paroxysm or fit of the gout, may yet be subject thereunto?

whether there be any necessity that the gout should be propagated unto the issue?

From

From all which it wil be no hard matter to render a Reason why the rich should be obnoxious and subject unto the Gout rather than the Poor; it being therefore by the *Germans* called also the Disease of the Rich. For it is very rarely found, that Boors or Beggars are troubled with the Gout; and hence it is also that the Gout is termed a Disease *hating the Poor*: and *Jovianus Pontanus* hath likewise a Fable to this purpose (in his 5. *B. de sermon.* and Chap 1.) that on a time the Gout rambling about, and going into the Country, when it saw there nothing but little Cottages most rudely and unhandsomly built, and very filthily scituated; and could find there nothing but Mattocks and Pitchforks, Rakes, and such like Rustical Instruments; she turns away from this place as altogether unfit for her entertainment, and betakes her self to the City, if haply she might there find better. But being brought into the City, at her first entrance thereinto, she lighteth upon the Shop of a Black Smith; and this she likewise passeth by as altogether unfit for her accommodation: but at length when she had a while rambled about in the City, she at last cometh into a certain house, before whose door was piping and Dancing, and within doors nothing but Jollity and Feasting; and demanding what and whose house this was, when she was answered, that it was the house of Ease and Idleness, and that it was inhabited by slothful Persons that spent all their time in Sleeping, Drinking Wine, and Feasting, she instantly enters the house, saying, This is indeed the house, and this the Palace that is fit for my reception and entertainment. And when at any time she saw sollicitude and Labor doing their business before the doors, she presently commands them to be set further off, and driven quite away; and chargeth that all Cares whatsoever should be banished from thence; and more especially, Sobriety and abstinence.

why the Rich are more troubled with the gout than the poor?

For Poor People and such as live in the Country are for the most part contented with a very sparing and plain Diet: whereas on the contrary, the Rich delight themselves with all variety of Meats, and drink their Wine most commonly without any stint at all; yea and oftentimes wholly addict and give themselves over to Gutting, Gluttony, and excess of Wine. And again the Boors in the Country are continually exercised with Labor, by the which the heat of the Bowels is stird up; and if at any time there chance to be any vitious humor it is immediately discussed; whereas for the most part the Rich do more indulge themselves in ease and idleness. And moreover the Rich are very seldom so careful to obey the prescripts of their Physitians as they ought to be, but they wil have the medicaments prescribed them to suit with their Fancies and Palats; neither wil they continue the use of them so long as is fitting and requisite; neither wil they have that care and regard unto the whol course of their Diet which they ought to have.

And besides all this, in the last place, the Rich do indeed make use of Physitians, but then they change them too often; and very frequently commit themselves unto Empericks, and others that are altogether Ignorant, or have but little knowledg of the case how it standeth with them; and these do oftentimes prescribe such remedies and medicaments as by the use of which the Disease is rather more deeply and faster rooted, than eradicated and pulled up.

Now this Disease is wont for the most part to invade and afflict men, rather than Women (not that these are wholly exempted from it, for we find the contrary by experience) and this more especially between the thirtieth and fiftieth yeer of their Age; to wit, because about that age, by reason of the sharpness of the heat, the salt and Tartarous humor is then more heaped up; and then after this the older they grow, the more they are afflicted with it, by reason of the weakness of the native heat, and the imbecillity of the expulsive faculty. For Men for the most part live not so temperatly as Women, sustain greater Labors, are more addicted to Venery, and hurt thereby. But Women (on the contrary) are more temperate, and besides they have likewise their monthly Evacuations, by and with which Nature is wont to thrust forth together with them all the vitious humors, and so to expel them out of all parts of the Body. Whereupon likewise it is, that *Hippocrates* (in the sixth of his *Aphorism. Aphoris.* 29.) writeth, that Women are not troubled with the Gout, until after their Courses fail and leave them. But the truth is, that it is not alwaies so that either Women or Men that are above or under the aforesaid age, are wholly free from this Malady; and albeit that *Hippocrates* (in the 6. *sect.* of his *Aphorism. Aphorism* 30.) writeth, that yong Men before the use of Women are not at all troubled with the Gout; and that it is a thing very rarely seen, that Youths are herewith affected, yet notwithstanding its sometimes found so to be, and that even these are troubled with it: as we may likewise see many that are above fifty yeers old taken oftentimes with the Gout. And I my self of late saw a Learned Man that in the sixty second year of his age was first of all troubled with

who they be that are most subject to the Gout.

fits

fits of the Gout. Neither also are Eunuches (although that *Hippocrates* in the *Sixth Sect.* of his *Aphorism. Aph.* 28. doth except them) alwaies wholly free from this Malady; as we shal anon shew you further in the *Ninth Question.*

Chap. 3. *Signs Diagnostick.*

The Diagnostick signs of the gout.

THe very Malady doth sufficiently appear of it self; and the sick persons complain of a pain about the Joynts in their Feet, Hands, Knees, and other parts; unto which there is afterward added a swelling, a redness, and for the most part a Feaver. And indeed, when the Gout begins first of all to invade a person, it likely taketh him first in the great Toe of his Foot, and that most commonly the left. And so in all the other joynts the pain most of all consisteth and staieth in the place affected, without spreading any further. But in the *Sciatica*, this pain is not felt only in the Joynt, (by the which the Head of the Thigh is inserted into the Hip) but it is from hence by the Nerves and Membranes carried unto the very Buttocks, by the way where the Nerves spring from the Loyns, and the great bone by the Latin Physitians called the *Os Sacrum*, or holy Bone; and from thence the pain is also extended unto the Calf of the Leg, and unto the Foot, according to the guidance and conduct of the Nerve. And in other Joynts also, (as lying outwardly) there is wont manifestly to appear a swelling, and redness, and a great heat to be perceived: but now in the Sciatick painful affect these things do not so plainly appear, in regard the place affected lieth very deep, and because that therein that place the top of the Skin hath not many Veins dispersed here and there in it. In a word; in the Gout that which most especially troubleth the sick person is the pain he feeleth, and an impotency in his motion; and upon this there follow watchings and restlesness, a dejection of the Bodies strength, and other Symptoms; all which *Lucian* in his *Tragopodagra* hath very elegantly described.

The signs of the Causes.

But now in reckoning up the signs by which the differences of the Causes and the different Humors may be discerned, the most of Physitians are very long and prolix; and they take much pains in reckoning up the signs of the Gout from the blood, Choler, Flegm, and Black Choler or Melancholy. But since that (as we told you before) those Humors cannot properly be said to excite the Gout, but only that they are either stird up and down by that Humor that is the Cause of the Gout, or that being attracted by the pain of the part affected they flow together thereunto; We shall therefore in this regard here spare our selves the Labor, further to treat of them.

But yet Nevertheless, if for the better ordering of the Cure the knowledg of the affluent Humor seem to be altogether necessary and requisite; it appeareth from the general discourse of an inflammation; in which we have declared what a pure *Phlegmone* is, and what signs it hath; as also the signs of *Oedematodes*, of *Erisypelatodes*, and also of *Scbirrhodes*, what signs these have; and indeed from the signs of the Humor predominant in the Body (which we have elswhere explained) and likewise from the qualities of the swelling, and by the observing of those things that benefit or hurt the sick person, it may easily be known what humor it is that floweth together with it.

And yet notwithstanding it is here acknowledged by the more learned and able Physitians, (even those who have asserted that the Gout proceedeth from divers humors) that there is little heed to be given, or regard to be had unto those signs that are taken from the Color, heat, or the like Accidents; since that very many things occur which may be the Cause, as of the Colour, so likewise of the heat and coldness of the Member, contrary unto the Nature of the peccant Matter. For the humor (as *Guainerius* saith) that is the true and proper cause of the Gout, abiding in the bottom of the Member, doth not for the most part change the superficies of the said Member; and so then the Color of the Member cannot afford us any sign or token at all: but it may possibly so happen, that a Humor abounding in the Body may by pain be stirred up and darwn unto the place affected, and there it may cause a swelling, and yet nevertheless it may not be the Cause of the Gout.

CHAP.

Chap. 4. *Prognosticks.*

Prognosticks of the gout.

I. THe Gout for the most part is a disease not Mortal. For albeit that the strength may be much impayred by pains, and for want of rest, (insomuch that the sick persons may at length be forced to take their Beds) yet this is not done, but in a long time. And we see that such as are troubled with the Gout do oftentimes live long, and attain unto old age; to wit, for this Cause, that Nature by certain intervals thrusteth forth unto the Joynts those vitious Humors from which other more dangerous Diseases might have been generated; and so by this means freeth the principal parts from vitious Humors.

II. If yet notwithstanding there happen any dangerous inflammations, or pernitious Feavers, or that Nature fayl and lie under the burthen, so that it can no longer expel the vitious Humors, the Patients life may then be much endangered. And if any such dangerous Symptom be Joyned together with the vehement pain of the Joynts (as suppose, a Deliry, the trembling of the heart, difficulty of breathing, cold sweats, and a weak pulse) it is then a sign that the sick person will die the very same day, or the day following.

III. But although the Gout be for the most part a Disease not Mortal, yet nevertheless it is very hard to cure; and it is commonly accounted the shame and disgrace of Physitians. For albeit (if the Disease be new) it may be cured without much difficulty: yet nevertheless, if it be long delaied, and that it often invade the party, it may be more difficult to cure, in regard that the Joynts, yea and the very Bowels are weakened by the pains, and restlesness, and likewise by the afflux of the Humors. And the sick persons are themselves oftentimes the Cause that this Disease taketh such deep Root in them, seeing they do not oppose and withstand the Disease at its first Invasion; yea and oftentimes they conceal it; and some there are that will pretend other Causes of their Disease, as loath to acknowledg it to be the Gout,

But now this Disease proveth afterward very hard to cure, both in regard of the many errors in Diet (from which the sick persons wil not be perswaded to abstain) and oftentimes also through the unskilfulness of the Physitians; who are either ignorant of the true cause of the Disease, or else they administer Medicaments that are very unfit and improper, by which they do rather weaken the Joynts and the Bowels then any waies strengthen them. But yet nevertheless, in the mean time, the Gout is not a Disease that in it self is altogether impossible to be cured; and this we are taught by the examples of many that have been freed from the Gout; of which more anon in the *Tenth Question.*

IV. Whosoever they be that being thus affected are grown in age, or have gotten about their Joynts *Callous* and hard knobs bunching forth; or that live an anxious and careful life; or have a dry and costive belly; these can none of them be cured by the Art of Man, or any human means, so far as I could ever yet find. *Hippocrates* in the Second of his *Predictions.*

V. If in the Gout there happen to be a loosening of the Joynt, it is then very difficult in the curing, or indeed altogether incurable. For although the Joynt may possibly be set back again in its proper place, yet nevertheless because that the Ligaments of the Joynts are made more loose, a perfect Cure is scarcely to be expected. And if likewise in the loosning that followeth upon the Gout the Cavity of the Joynt be filled up with a hard knotty matter, the Disease is then altogether incureable: for the Joynt cannot be put back again before that Tophaceous matter be taken away; and this will hardly ever be removed.

VI. Among all the several kinds of the Gout, the *Sciatick* pain is of all others the most grievous, not only in regard of the greatness of the pain it self, but by reason also of the grievousness of the Symptoms that follow thereupon. For by reason of the most grievous pain it causeth watching and a restlesness, kindleth feavers; and sometimes a loosning of the Joynt happeneth, upon which there followeth a lameness and a wasting away of the whole Leg and Thigh. For if at any time a Joynt fal out of its place, by reason of the multitude of the affluent Humors, there

is then a Necessity that an halting and lameness must follow upon it. But because that the bone being fallen out of its proper place presseth together the Muscles, Veins, and Arteries, the Aliment and Spirits cannot possibly flow into the lower parts, whereupon there followeth a wasting and Consumption of them.

VII. But although this *Sciatick* pain be of all others the most vehement, yet notwithstanding, it doth in the beginning more easily admit of a Cure then any of the other kinds of the Gout, in regard that the strength and Virtue of the Medicaments may more easily penetrate unto the Vessels, (by which the Humor floweth into the Hip) then unto the extream Joynts; and so likewise the Humor that floweth unto them may the more easily be evacuated. But if the Humor be once flown in, so that it hath insinuated it self into the Hip, it is then very hard to be cured; because that the Discussing Remedies by reason of the flesh lying upon the Joynt cannot penetrate whither they ought to go.

VIII. *They that having been long infested with the pain in their Hips have the Hip falling forth of its place, and again returning and falling into its place, these have snotty Excrements following thereupon,* (*as* Hippocrates *telleth us in the* sixth Section *of his Aphorism. Aphoris.* 59.) these Mucous and snotty Excrements having their original from the weak heat of the Nervous parts.

IX. *They that having been long infested with the pain of the Hips have the Hip falling out of Joynt, these have their Thigh wasting, and they become lame, unless they be burnt: as* Hippocrates *tells us in the same place, Aphorism.* 60. The Thigh indeed consumeth and wasteth away, because it is but ill nourished, by Reason of the weakness of the Native heat from the long continued afflux of the Vitious Humors; and because that the Veins and Arteries are moved out of their places, and pressed together, so that they cannot rightly bring the aliment unto the Thigh. But then they become lame, and halt, because that the Thigh for want of nourishment is destitute of strength, and by Reason of the Luxation or disjoynting is become shorter then before, and that by means of the loosness of the Ligaments the Thigh bone is not fast and firm.

X. Those unto whom the Gout is hereditary are scarcely ever wholly freed therefrom; and if they desire so to be, they have need to observe a far more exact kind of Diet and a more accurate use of Medicaments, then do others that are either not troubled at all with this affect; or if they be, the grief descends not to them from their Parents, or any of their Ancestours.

XI. If the *Varices* happen unto such as are troubled with the Gout, the Gout then ceaseth, (as *Avicen* tels us, because that the Humors that were accustomed to flow unto the Joynts are now derived unto the exterior parts of the Thigh.

XII. If the Gout that was wont to keep its certain Periods cease and return no more, it proveth to be the Cause of most grievous and deadly Diseases, unless the matter be drawn forth by way of prevention, which is most difficult to be done. For the matter that Nature was wont to thrust into the joynts, if by Reason of the weaknes of Nature it can be now no longer expelled, either it sticketh about the Bowels, and principal parts; or else being transmitted unto the Lungs, Intestines, or other parts, it there exciteth most grievous Evils.

whether the Gout may not be finished in less then forty daies and why?

XIII. As for what concerns the very Paroxysm it self, touching this *Hippocrates* writeth in his sixth *Sect.* and 49. *Aphoris. They that are troubled* (saith he) *with the Disease of the Gout, these may in fourty daies be cured of their fits, by removing the inflammation; provided that* (*as* Galen *adds in his* Comment.) The Physitian fail nothing in the Cure, and that the Patients be obedient unto his prescriptions. For seeing that the Humors in the Gout are dispersed by the Ligaments, Membrans, and Nerves, and that these parts are more thick, and more cold then the fleshy parts, it is therefore no wonder at all, that there is a longer time for the discussion of the Humor required in these parts, then in the fleshy parts. But yet this Aphorism is here only to be understood of the last and very utmost term; seeing that experience testifieth, that many have been Cured of the Gout within fewer then fourty daies. For in some the fits of the Gout are more moderate, and shorter, and so may be made to cease in a shorter time: but in others they are more sharp, and of longer continuance; and therefore require the longer time. And some there are that refer the cause unto the Humors; and those tel us for a truth, that the Gout which proceedeth

proceedeth from Choler is shorter, but that which is from Flegm of longer continuance. But be it so indeed, that sometimes the Blood, sometimes Flegm, and sometimes Choler may together and at once flow unto one and the same part; yet nevertheless, that very Salt Humor which is the next and most immediate cause of the Gout is sometimes thinner, (so that it may be the sooner and more easily discussed) and sometimes it is more thick. Unto which we may in the Second place add, the strength or weakness of the part affected. For the stronger the part is, the more easily doth it discuss the Humor that hath flown unto it; but the weaker it is, the more slow it is in dissipating the said Humor; and from hence it happeneth that those which first begin to be troubled with fits of the Gout have these fits shorter; and in such as have been longer troubled with this Disease the Paroxysms are of so much the longer continuance, unless they have the greater care of themselves. For the oftner any member is afflicted with the Gout, the weaker still it groweth. And Thirdly, the sick persons themselves also do not observe one and the same course of Diet; whereupon it is, that such of them as observe an accurate and exact kind of Diet, these are more easily freed; and some of them do by the Errors of their Diet much prolong unto themselves their Paroxysms, and give the Cause of a new fluxion.

XIV. The more, and the more frequent the Symptoms are that follow upon the Gout, the harder is the Disease to be cured. For sometimes by Reason of the most sharp and vehement pain, the sick persons do unseasonably desire repelling and stupefying Medicaments; which drive back the Humor that was flowing unto the joynts unto the more noble parts: and from hence it happeneth, that the sick persons fall into the affects of the Heart by Reason of its being streightned; into Faintings, and Swounding fits, or other mischievous Diseases: yea and they may be cast into great peril of their lives; and then the only hope they have of escape lieth in this; to wit, that the aforesaid Humors (if it possibly may be) be again driven back unto the joynts.

XV. Now there are four manner of waies to dissolve and cure the Gout. For first of all (and more frequently) the matter is resolved, and indeed all of it, so that there are not left so much as any footsteps thereof remayning; or (as for the most part) nothing but the very signs and footsteps of it are left behind: And *Secondly* (but this is more rare) the matter is changed into a substance very like unto *Pus*. For a true and genuine *Pus* it is not; but a certain *Sanies*, or thin Ichorous Excrement, sweateth back and Eateth its way through both the Flesh and the Skin. *Four ways of dissolving the Gout.*

But now why the Gout cometh so seldom unto a suppuration, is well worthy our consideration, and enquity. Some are of this Opinion, that it is therefore because that the joynts are removed from the Fountain of heat, and have not in them so much heat as is requisite for a suppuration. But that this is not the true cause, appeareth by this, that sometimes there ariseth an inflamnation in the ends of the Fingers, which yet nevertheless cometh unto a suppuration. And therefore a more true cause seemeth to be this, to wit, the Nature of this very Humor it self (as being Salt, and wheyish) which is not to be changed into *Pus*; but it is either inwardly dissipated; or if any of it be left remaining, it groweth and hardneth into knots and knobs. The Third way and manner is, when by Reason of the weakness of the place, the matter sticking over long in the part affected, is at length turned into a knot or knob. And of such a Gout as this it is that *Galen* writeth (in his 10. B. of the *Compose. of Medicam. according to the place*, and 2. *Chapt.*) *after that the Calli are once produced*, (saith he) *there is no further hope or expectation, that the Joynt should ever exactly return unto its pristine Constitution.* And of this the Poet, *Tollere Nodosam nescit, &c.* *Why the Gout is so rarely suppurated?*

That Physick worketh rare effects, ther's none can doubt,
And yet it knows not how to Cure the knotty Gout.

The Fourth manner is, when the Humor is transferred, and carried unto some other place, and (as it sometimes happeneth) unto the more noble Members, to wit, the Lungs, the Heart, the Brain; and this of all other the changes is the worst, and by reason whereof the sick persons die, unless the matter be drawn back again unto the joynts; and sometimes the Humor is translated unto the more ignoble

parts, as the *varices*, according to what we said before in the 11. *Prognost*: and sometimes it is evacuated quite out of the Body; and as *Rhases* tels us, it is oftentimes carried unto the Intestines, and there it exciteth a flux of the Belly, and excoriateth the said Intestines; and this flux continueth sometimes all the life after, and the strength by degrees and by little and little failing, (by reason of Feavers and pains) the sick persons after long wasting and consuming by Marasms, at length they die.

Chap. 5. *The Indications and Cure.*

The indications & Cure of the Gout.

SInce that the perfect Cure of preternatural affects doth chiefly consist in the taking away of the Causes, and that the Authors (as we told you before) differ among themselves as touching the Causes of the Gout, it is therefore no wonder, that there is so great a discord among them about the Cure, some propounding one way, and some another, for the Curing of this Disease. Which difference and variety of opinions; (as we have sometimes already told you) hath not been the least (but indeed the greatest) cause why so few of those troubled with the Gout have hitherto been cured thereof; each Physitian here setting himself to oppose that as an enemy which he hath often to himself fancied so to be, and in the mean time altogether neglecting that which is indeed the true enemy. And this evidently appeareth from the *Consilia* or advisings of Physitians one with the other (which have likewise been in the behalf of persons of the greatest worth and quality) in the most of which (opinions being asked, and resolves sent from one to the other) the whole result of the business for the most part came to this, that the Cure was chiefly to be directed to the head, as the commanding Member; and unto the Joynts, as the recipient Member. And so the authority of *Fernelius* alone (a Physitian otherwise of great learning and experience) hath drawn very many into the same error with him, and kept them from searching after the truth; and hath likewise caused that many sick of this grief have taken such Physick, and several sorts of Medicaments that were very unfit, and altogether improper for them. We therefore (leaving unto every man his Judgment and Opinion) insisting upon those Fundamentals which we have above propounded, will here briefly declare our Opinion as touching the way and Method of Curing the Disease we are now treating of.

Why so few have been Cures of the Gout.

The Cure of the gout

Now the Cure so called in general consisteth in two things: the former whereof is, that the present Paroxysm (whether Pain, Swelling, Impediment of the motion, and all other things that are wont to be troublesom unto such as are afflicted with the Gout) be taken away. And the other is, that a course be taken to prevent the return of the Paroxysm being once removed.

And in the first place indeed, for the manner of Curing the Gout that is present, there are three things especially, which (in the Paroxysm) the Patient desireth a speedy removal of, *viz.* the Pain, Swelling, and the Impediment of his motion. And now seeing that all these three have their original from a preternatural Humor fallen into the joynt, the total removing of the Paroxysm consisteth in this, that the influx of the Humor be withstood, and that the Humor already fallen in be taken away. For that Humor being removed, there followeth both a cessation of the Pain, and a vanishing of the swelling, and the motion of the part again returneth. But yet nevertheless, in regard that the pain doth oftentimes so extreamly excruciate and Torture the sick Person, that he cannot well bear it (until the Humor the Cause thereof be taken away) the pain is therefore sometimes first of all to be moderated, yea even before the Cause be wholly removed. And so then the whole Cure of the Gout afflicting the sick Person consisteth in the taking away of the Cause, and the mitigation of the pain.

As for the first of these, seeing that the flux taketh its beginning from the motion and boyling as it were of the blood and Humors in the Veins, that motion and boyling of the Humors is first of all to be stopt; and the Humors that with violence rush unto the part affected are not only to be turned another way, but they are also to be wholly evacuated, and emptied forth out of the Body; for unless this be done,

done, the pain wil be but the more exasperated. And afterwards the humor that hath flown in is to be discussed and scattered. And because that pain is the thing that chiefly grieveth the sick Person, this is sometimes also to be mitigated even before the Cause be taken away.

And therefore if any Cause, either external (to wit, the distemper of the Ambient Air) or the thicknes of the body shal have given the occasion, it is forthwith to be removed, yea and also to be corrected after a quite contrary manner.

Venesection.

And secondly, If Blood abound in the Body (which may be also so moved by the violent motion of the humor that it may as it were boyl, and by the pain be attracted unto the part affected, and so concur as a Joynt Cause of the Gout, and may possibly likewise augment the Malady) and that moreover a Feaver be threatned as neer at hand, or else if it shal accompany it; then in this case (if the Patients strength wil bear it) Blood-letting is to be instituted, that so the afflux unto the part affected may be diminished, and that that fomenteth & addeth fewel unto the approaching Feaver may be withdrawn, and yet notwithstanding so that there be not too great a quantity of the Blood evacuated. But if there shal be no danger at al threatned by the abounding of the Blood, or that also a flegmatick humor aboundeth, Venesection is in this case rather hurtful than any waies useful and profitable, in regard that then by the evacuation of the Blood the Spirits may be dissipated and the Native heat wasted; whereupon the heat in the part affected may be so weakned, that it may not be able to overcome the humors in the part affected, and so easily to scatter them; and hence it is that the Patients are longer ere they can recover their strength and health: yea and sometimes also there are by this means hard knobs and knots generated in the Joynts. And if all or most part of the Joynts be affected, then the basilique Vein (either in the right or left Arm) is to be opened. But if one only Joynt be affected, then the opposite Vein is to be opened. As for example, if the Joynts in the right Arm be affected, the Vein in the left Arm is to be opened: and so on the contrary. If the right Foot be troubled with this grief, then the Vein of the right Arm is to be opened; if the left Foot, then the Vein in the Arm is to be opened on the same side. For this is more commodious, than to open the Vein in the Foot of the opposite side: for by that former Venesection the fluent humors are drawn back; whereas by this latter they are only derived unto some other part. And the like is to be done if the pain be in the Hip. *Venesection.*

Venesection in the Arm (in the Sciatica pain) being premised for derivation, a Vein may afterwards very fitly be opened in the Ham, or neer unto the interior Anckle (or also the exterior) in the Vein there appearing, which (by reason of the great benefit it bringeth unto the sick Person, if it be then, and that in due time opened) they cal the *Ischiadick*, or Sciatick Vein, which (and that very often) alone cureth this Affect. But yet for the most part it is opened in the pained Thigh; although that *Platerus* writeth, that upon the opening of a Vein also in the sound and unpained Thigh very great benefit hath followed thereupon, and that all the pain hath thereby been suddenly and unexpectedly taken away,

But in regard of the urgency of the Malady, and that the Flux cometh very speedily, therfore even forthwith (if there be occasion) Venesection is to be instituted, and as much of the Blood as is needful (if the strength of the Patient wil bear it) to be taken forth at once opening of the Vein. But if the Patients strength wil not bear nor allow of a more large evacuation of the Blood all at once; then at several times, and by intervals so much of the Blood is to be drawn forth as may answer unto the Bodies fulnes thereof. Instead of this Venesection Cupping-glasses may also be applied, which are wont to be affixed (in the very first beginning of the Pains) unto the sound opposite part with Scarification. And so likewise Leeches applied in the accustomed places for the Hemorrhoids bring some kind of benefit unto the sick Person by their drawing forth the Blood. *Cupping-glasses, and Leeches.*

Purgation.

These Revulsions by the Evacuation of the Blood being thus made, purging is then next of all to be appointed unto the Patient; touching which although there be some that think otherwise (as we shal afterwards further shew you in the 11. Question) yet for the most part it is very fitly and successfully administred. But it is instantly to be ordained (even in the very beginning of the pains, or if occasion be, when they are suspected as nigh *Purgation.*

at hand) before such time as by the said pains, as also by restlessness and want of sleep; or by the augmentation of the Feaver the strength be too much impaired; neither need we here to expect any Concoction, or use any preparation before; which most of the Physitians of former Ages were wont to do, who first of all made use of Lenitives, and then Secondly, Preparatives (or Digestives as they call them) for some certain daies; and Lastly, of Purgers that draw the humors from the Joynts. For even then when the humors have already before been in their motion, and are become thin, and that Nature her self endeavoreth the separation of them, as burthensome to her, from the good Blood, (and that there is cause to fear lest that, as we said before, ere ever any such things as these can be done and finished the humors may rush unto the Joynts, and that by pain and want of rest the strength be too much dejected, and that a Feaver following thereupon forbid a Purgation) even then the Purgation is forthwith to be instituted. And the exhibition of one only Purge doth for the most part less hurt and offend the stomack than those so often repeated digestive Potions, which resolve and weaken the Stomack, so that the Crudities being afterwards augmented, there is caused a greater afflux of humors unto the Joynts.

Altering Medicaments.

Alterers. Yet nevertheless, if the humors be over-hot and sharp, they may be attempered by Broths altered by Cichory, Endive, Sowthistle, Purslane, Sorrel, and Medicaments made out of these: neither are we to omit the administring of the Conserve of Roses with the *species Diatrion santalon*, it being of singular use in the altering of the humors. As,

Take *Conserve of Roses three ounces, Spec. Diatrion sant. one dram, Red Coral one scruple, and with the Syrup of Pomegranates make an Electuary.* Or,

Take *Margarites prepared one dram, Red Coral prepared, and all the Sanders, of each one dram and half, Red Roses one dram, the Bone taken out of the Staggs heart one Scruple, and make a Pouder. Or else with Sugar dissolved in Rose Water make little Rolls.*

But now as touching Purgation, we are to advise you in these two things especially. First, that a fit time be made choyce of (as we gave notice before) and that the Purgation be not too long deferred. For if already the whol humor be flown in unto the Joynts, it is easily called back. And therefore, that the humor which is now ready to flow into the Joynts may be turned unto the belly and by it be evacuated presently in the very beginning of the Paroxysm (yea and also so soon as ever we do but suspect it to be nigh at hand) the Purgation is to be ordained, and administred; for by this means the humor that is now flowing, and that which was after to flow, is evacuated by convenient places, and hindred that it rush not to the part affected; and the encrease of the pain and swelling is hereby prevented; and so that which hath already flown in unto the part affected is easily dissolved. And experience it self testifieth that this kind of Cure hath profited very many. And so *Petrus Bayrus* writeth of himself, that he himself being by four men carried to the Close Stool, after that he had four times eased his Belly (having before taken his own *Caryocostin.* Electuary) he was freed from all his pains; and that he could then go without help from any other.

And then Secondly, It is to be considered, by what Medicaments the Purgation is to be instituted and begun. Some think that we ought to abstain from the stronger sort of Medicaments, and to make use only of those that are more mild and gentle (or of the stronger in the smallest quantity) because that a strong purge may draw store of humors from the more ignoble and external parts unto the more noble; and so it may sometimes happen that some of these sick Persons may by a vehement and strong Purge fall into burning Feavers, as also Feavers Malignant and Mortal. Which as we willingly grant, and think that the humors that were hot before are not by vehement Purgers to be more inflamed; and that the motion of Nature is not altogether to be disturbed: so also on the other hand we conceive that great care ought to be taken, that the humors be not only stirred and moved up and down in the Veins, and not wholly drawn forth, and sufficiently evacuated. Which when it happeneth, they afterwards rush with a greater violence unto the part affected, as unto the which they are withal attracted by the pain. And therefore in the beginning of the Paroxysm, or when it is nigh at hand, we ought to make choyce of Medicaments that are somwhat stronger than ordinary; and yet notwithstanding such as do no way offend the Stomack. For (as we said before) if we make use of those that are too gentle and weak in their operation, the humors are then only moved up and down in the Body, and nothing worth speaking of is evacuated; whereupon there is afterward a greater Conflux unto the part affected.

But

But now, that during the purgation there may be no Conflux unto the part affected, and that the Humor being moved by the Purgation may not ruſh unto the part affected, this we ought carefully to prevent; and it is done by placing the part affected in a higher place in the Bed, until the Purgation ſhall be fully finiſhed; or (which is the more ſure and certain way) by impoſing a defenſive Medicament (after the adminiſtring of the purge) upon the head of the part affected. As for example, if the pain be in the Hand, the defenſive is to be placed upon the Shoulder; and this may be made and provided of the *Flowers of Roſes, Pomegranate flowers, Roots of Biſtort, Tormentill, the greater Conſound, the Rinds of Pomegranates, Bole-Armenick, mingled with the white of an Egg, and Roſe water, or Vinegar.* And that this Cataplaſm being dried, and ſo made hard, may not excite Pains, and thereby further provoke the flux, a little of the *Counteſſes Unguent*, or of the *Oyl of Roſes Omphacine*, is to be added thereto. Or elſe inſtead of the Cataplaſm, a ſwathe that is long enough may be wet in poſſet (in which Oak-moſs, Red Roſes, or other Aſtringents even now mentioned have been boyled) and drawn over the upper part; as for inſtance, (in the Gout of the Feet) upon the part above the Knees. And thoſe Defenſives are to be continued ſo long as the Purgation laſteth, yea for the whole day, as we ſee occaſion.

But now we cannot in general define, with what kind of Medicaments this purgation is to be performed, in regard of the great variety there is in Bodies. For although the Humor (the nigheſt cauſe of the Gout) be wheyiſh, Salt, and Tartarous; yet nevertheleſs this very Humor is in divers Bodies conſtituted after a different manner; and hurrieth along with it other Humors alſo that abound in the Body. Yea and in one and the ſame Body the ſame Medicaments are not alwaies fit and proper, becauſe that the ſtate of the Body is not evermore one and the ſame. And therefore the Phyſitian ought to be preſent with the Patient, when he preſcribeth ſuch like Remedies.

Now for the Evacuating of Serous Humors, and Cholerick *Ichores*, ſuch as theſe following ought to be provided, *viz. Syr. of Roſes* ſolutive, *de Spina Cervina*, (*commonly called the Domeſtick Syrup*) *Manna, Mechoacan, Sene, the Seeds of wild Saffron*, and the compounds from any of theſe; as alſo *Electuar. Diacatholic. Triphera Perſica, de Succo Roſarum.* And ſo likewiſe in the ſtronger kind of Medicaments, thoſe are of ſpecial uſe that are made of *Hermodactiles*; and among them the *Caryocoſtine Electuary* of *Bayrus*; of which we ſhal anon make further mention, when we come to ſpeak of the *Preſervation* from the Gout. Or,

Take *The Choyceſt Turbith, and Hermodactiles, of each three drams, Diagridium one dram and half, Ginger and Maſtick, of each a dram; Sugar ſix drams; make a Pouder hereof; the Doſe whereof is one dram, or a dram and half, with fleſh broth.*

Or, Elſe let the Patient make uſe of the Pills of *Rhaſes*, which (as he writeth in his 9. *B.* to *Manſor. Chap.* 90.) will preſently make and enable thoſe that keep their Beds to Riſe, ſtir and walk up and down; and they are in this manner to be Compounded.

Take *Aloes one dram, Scammony half a half peny weight, red Roſes a double quantity to the former, Hermodact. half a dram.* Make pills thereof, and give them all at once, and yet not without regard unto the ſtrength of the Patient.

But now, although the ſerous or wheyiſh Humor be the nigheſt cauſe of the Gout; yet notwithſtanding becauſe that this Humor doth alſo violently carry along with it other vitious Humors in the Body (and eſpecially when the pain cometh) the Phyſitian therefore ought to be preſent with the Patient, when he is to preſcribe ſuch various purging Medicaments for the preſent occaſion of the ſick Perſon.

Vomitories.

A Vomit is likewiſe very uſeful in ſuch as are accuſtomed thereunto; and ſeeing that it may Evacuate the Humor by a ſhorter way, there is no ſuch cauſe to fear the ruſhing of the Humors unto the part affected. *A Vomit.*

And yet notwithſtanding we dare not here give ſuch ſtrong Vomitories that may evacuate the Humors out of the very Veins; but it will be ſufficient if ſuch be adminiſtred

miniſtred that do evacuate the firſt waies and the parts neer unto the Stomach. For if there be many vitious Humors reſiding about the Stomach, Spleen, and the hollow of the Liver, and in the places neer thereunto, it may very eaſily come to paſs, that theſe Humors being ſtird up and down throughout the whole Body, they may both penetrate unto the Veins, and ruſh unto the part affected. And purges may be likewiſe appointed unto the ſick perſon after his vomiting; yea and if one purgation will not ſerve the turn, it is again a Second time to be repeated. *Franciſcus India* (in his 2 *B.* of the *Gout*, and the *Third Chapt.*) doth here wonderfully extol a Vomitory that he maketh of *Butchers Broom*, a ſufficient quantity of the pouder thereof, given with the *deſtilled Water of unripe Oranges* a little warm; which (as he writeth) can with ſpecial benefit unto the ſick perſon Evacuate both the Choler and the Flegm, not only upwards, but downwards alſo.

Sudorificks, or *Sweaters.*

Sweaters. The Body being ſufficiently purged, we are to endeavour that ſweat may be provoked, either of its own accord, or elſe by adminiſtring of Medicaments: For (as *Crato* writeth truly, in his 24. *Conſ.*) if the ſweat be at all deteined within, and hindered from coming forth, (eſpecially if the Patient hath been accuſtomed thereunto) it will not be long ere a fit of the Gout come: yea and without all doubt, the Paroxyſm will be much augmented and provoked, if in it the ſweat be deteined, and if the remainders of the wheyiſh Humor in the Veins be not diſcuſſed and Scattered; and on the contrary, the Paroxyſm wil be the ſhorter, if the *Serum* or Whey be by ſweat diſperſed. But ſince that in the firſt invaſion of the Gout there is as it were a certain kind of boyling of the Humors, and that for the moſt part there is likewiſe preſent a Feaver, in this regard hot ſweaters (ſuch as are *Treacle*, *Mithridate*, and the like) are here ſcarcely fit and convenient, becauſe that by them the Humors may be the more inflamed. But yet *Harts-horn* (either crude, or prepared without any burning) may be very fitly exhibited, either alone, or with the Water of *Carduus Benedictus*. And ſo likewiſe *Diaphoretick Antimony* is very uſeful. But if the Conſtitution of the Body, and the diſpoſition of the Humors wil bear it, the Decoction of *Saſſaphraß*, or *Sarſaparilla*, or *Chyna*, may be adminiſtred; which yet nevertheleſs we ought to temper with *Succory*, *Endive*, *Sowthiſtle*, and *Dandelion* or *Lions Tooth*. But yet al thoſe things that are uſeful in the Paroxyſms, for the diſcuſſing of the Humors either ſenſibly or inſenſibly, they have not all of them their place here in the Cure. And ſo likewiſe the Decoction of the greater Dock, or Burr (in regard that it cutteth, diſcuſſeth, moveth ſweats and Urins) is very uſeful; and *Forreſtus* relateth that *Vaſtellius*, a Penſioner at *Mecblin*, when he was forced to keep his Bed by reaſon of the pains of his Joynts (inſomuch that he was not able to move or ſtir any one Member) he drank warm Beer in the which there had been boyled the Root of the greater Dock; which having drunk up, (when he could not be cured by any other remedies of the Phyſitians) he made a great deal of white Water, (his Urine being like Milk) and ſo was freed from all his pains. Or,

Sweaters of what kind they muſt be.

Take *Sarſaparilla*, *one ounce*, *Saſſafras Wood half an ounce*, *the Root of the Clove Tree one ounce*; *Citrine Saunders two drams*; Infuſe all in three pints of Water, for twenty four hours, and afterward boyl the ſame; and give of this Decoction one draught in the morning, either alone, or elſe with Harts horn.

Topicks.

Topicks. The Body being thus in a due manner evacuated, and the Antecedent cauſe (that would have augmented the Diſeaſe) being once taken away, we then come to the very moderating of the pain, and the taking away of the Conteining Cauſe of the pain and ſwelling, and ſo unto the Topicks. But if Topicks ſhall preſently be adminiſtred, before thoſe Univerſal and General Remedies ſhall have been firſt made uſe of, the Patient ſhall receive from thence far more hurt then benefit. For either the matter which Nature endeavoureth to thruſt forth to the Joynts is driven back unto the more inward parts (from whence very grievous Symptoms are excited:) or elſe it is impacted into the Joynts, and ſo the pain is exaſperated: or elſe the part

part is effeminated and made weak, and loosened; and so the flux is increased. Which being not commonly taken notice of, and Topicks being oftentimes most unseasonably and without any caution at al administred, the sick persons do for the most part receive more hurt then good from them; and from hence it was that the common and received opinion had its first original, to wit, that the best course is, to administer nothing at al unto the pained Joynts. And the truth is, that it is far better to apply nothing at all (but to commit the whole business to Nature,) then to make use of such Medicaments as are altogether unfit and improper.

Now the Topicks that are applied, they respect either the pain only, or else withall the Cause of the pain, to wit, the Humor that now and formerly hath flown in, exciting both a pain and a swelling.

Mitigaters of Pain.

Mitigaters of Pain.

The Pain in this Disease for the most part is a most grievous Symptom, and which is most troublesom to the sick parties, and which they most of all Curse and Bann, (as *Lucian* hath it in the beginning almost of his *Tragopodagra*) and therefore also it is that they most of all desire the removal thereof. And indeed it is altogether necessary that the Physitian should have regard thereunto, because that if it be too great, it causeth a restlessness, dejecteth the strength, and by attracting the Humors it augmenteth the Malady, and so deservedly draweth our care unto it, for its removal; (as *Galen* in the 12. of his *Method*, C. 1.) and thereupon it sheweth, and pointeth us unto the aswaging thereof by Anodynes. Now Anodynes or Mitigaters of pain have likewise this Good and benefit going along with them, to wit, that by loosning the parts they make that the Humor that before flowed only unto the interiour parts about the Joynts, comes now also to flow and be diffused unto the Ambient and fleshy parts. And hence it is that the pains in the Gout, before the swelling of the part, are most Vehement and intollerable; and that so soon as the part affected begins to swel, they are much Mitigated.

But now these Anodynes of what kind they are, we have told you elswhere, (in our *Institutions*) to wit, such as mollifie and loosen the part affected, and yet do not discuss the very Cause it self. And here they may be provided of Goats Milk newly drawn out of their Dugs, as also white bread and Milk, together with the Yelks of Eggs, and a little Saffron; as likewise of the Leaves of Marsh-Mallows, Mallows, Colewort, or Cabbage, laid upon the place affected as hot as the Patient can well endure them; as also of Mallow Seeds, Seeds of Marsh-Mallows, Quinces, Fleabane, (and especially the Mucillages of them) Cassia newly drawn out of the Pipe with the Decoction or Water of Nightshade; which (as *Avicen* tels us) is the best Remedy that can be; unto which (if there flow any hot Humors thereunto) we may add some of the Oyl of Roses, or Rose water; but if the flowing Humors be cold, then we are to add thereto the Oyl of Camomil: and instead of Cassia out of the Pipe, we may likewise make use of the Rob of the Elder Tree; of white bread and Wine; and indeed if the Humor be more hot, red Wine; but if cold, or betwixt both, then white Wine with the pouder of Camomile flowers and Oyl of Roses; of Cheese new made of sheeps Milk, and imposed upon the pained part, and often changed; of fresh-made Ox or Cow dung in the first beginning of the Spring, as also the Water that is distilled out of it. A most useful Remedy also is the *Mucillage* of *Fleabane Seed* extracted with the Water of Roses or Night shade; unto which sometimes a little Vinegar may be added; and this Medicament is by *Serapion* and others very much commended.

In the very first beginning of the Disease, *Solenander* taketh the thick stalks of Hemlock, and fils them with Salt, and then stoppeth them with Clay or Paste, and puts them in a moist place that the Salt may dissolve; which liquor he keeps in a glass, and with Clothes applieth it unto the pained part.

And he oftentimes also made use of this Cataplasm:

Take *Mallows, the whole Herb, Root and all, cut it into very smal pieces; and boyl it in equal parts of Wine and Vinegar, in a new Earthen Vessel, until a third part be wasted away; and then mingle therewith the thicker Bran of Rye, as much as will suffice for the making of a Cataplasm, and apply this hot unto the grieved part.*

Forrestus

Forreſtus relateth, that he knew one that added hereunto a little Barly flower, and that of the Water Lentile, boyled in Milk with Camomile flowers; and ſo reducing them into the form of a Cataplaſm, he put them upon the part affected with miraculous ſucceſs, as one could judg no other of it. And here alſo very uſeful is the Yelk of an Egg reduced into the form of a Liniment with the Oyl of Violets; and ſo is alſo the Water of the Sperm or ſeed of Frogs, which perhaps have in them ſome kind of Narcotick quality. *Adrianus Spigelius* writes, that among the *Moravians* there is in uſe a very notable Remedy, and noble experiment (for the ſpeedy curing of the Gout-pains) to wit, the *Water* of *Meadow Sweet*, diſtilled with its Roots and Flowers; and this water is likewiſe in frequent uſe among the *Sileſians*. And it is alſo very convenient to foment the part affected with the Decoction of *Parietary* or Pellitory of the Wall.

And very many there be likewiſe that make uſe of Oyls and Fats. But here we are to give you this Caution (and good cauſe there is alſo for it) that theſe Oyls and Fats are warily and carefully to be made uſe of. For in regard that the Gout hath often ſome kind of alliance with the *Eryſipelas* as to the cauſe thereof; and that it is a thing generally wel known, how that all fat things that ſtop up the pores in the *Eryſipelas* do more hurt than benefit; the very ſame ſeemeth likewiſe to be feared in the Gout, leſt that the Pores being ſtopt up by theſe fats, the humor being detained within, the pain may be augmented; and this even [illegible] experience teſtifieth. And it was related unto me by a certain honeſt Neighbor of mine, [illegible] himſelf in the aſſwaging of the Gout pains in his own Body, found nothing to [illegible] Cheeſe of Sheeps Milk new and freſh made, and laid on, but often renewed. For no ſooner did the Cheeſe begin (being made hot by the heat of the part) to become fat, and to drop forth butter as it were, but (as he ſaid) his pain was thereupon very much increaſed.

Take *the Pith of wheaten Bread half a pound, and boyl it in as much new Milk as wil ſerve to make a Cataplaſm: and then add of the mucilage of Marſhmallow ſeeds two ounces, the meal of Linſeeds and Fenugreek of each two drams, Powder of Camomil flowers and Melilote, of each one ounce, Saffron one dram, Oyl of Roſes and Camomil, of each half an ounce, and mingle them wel together.* Or,

Take *Milk newly come from the Cow one ounce and half, Crumbs of white Bread five drams, Barly meal one ounce and half, the common Hermodactyles ſix drams, Saffron one dram. Oyl of Camomile as much as wil ſuffice, and make hereof a Cataplaſm.* Or,

Take *white Bread ſix ounces, Milk as much as wil ſuffice, and mingle them wel at the fire; and then add the Yelks of two Eggs, Electuary of Roſes two ounces, Saffron one ſcruple, and mingle them.* Or,

Take *the Meal of Barly, of Beans, of the bitter Vetch* Orobus, *of each one ounce, of Linſeed ſix drams, the Powder of Camomile flowers three drams, of Melilote two drams, of Saffron one ſcruple; boyl them in a ſufficient quantity of the Water of Camomile flowers; then add the Yelks of two Eggs, Oyl of Camomile and Roſes of each one ounce, and mingle them.* Or,

Take *the ſoft Crumbs of Wheaten Bread one ounce, Powder of the Mullein flowers two ounces; boyl them in Milk; and then add of the flower of Caſſia one ounce, and mingle them.* Or,

Take *of Linſeeds and Fenugreek ſeeds equal parts of each: let the Mucilage be drawn out of them with Roſe-water; and then add the yelks of two Eggs, and a little Vinegar; and then ſprinkle in Bean Meal, and make a Cataplaſm.* Or,

Take *Meal of Barly, of Linſeed, of Fenugreek, of Beans, Powder of Camomile flowers, of each half an ounce; Marſh-mallow Roots one ounce, Oyl of Roſes and Camomile, of each one ounce and half; Yelks of three Eggs, the Rob of Wine one ounce, mingle them and make a Cataplaſm.* Or,

Take *the flowers of Mulleyn as much as you think fit; infuſe them in a ſufficient quantity of Red Wine for two months, and then let them be diſtilled; let the place be fomented with the diſtilled water, and then after anoynted with the Oyl or Liquor of Mulleyn flowers that is in the Summer time collected by the Sun-beams in a Glaſs cloſe ſtopped.* Or,

Take *the yong and tender buds of the Hazel Tree; preſs the Oyl out of them after the ſame manner as it is wont to be made of Linſeed. The Body of it that remaineth after the preſſing forth of the Oyl, let it be burnt; and out of the Aſhes let there be the Salt drawn forth with pure ſpring water, and let this be mingled with the aforeſaid Oyl. The Oyl when it is mingled with the Salt, let it be clarified by pouring and paſſing it through a Box*

of

of Wood (as Painters are wont to clarifie the Oyl of Linseed for their own use) and so it becomes a very excellent Medicament for the mitigating of pains.

But now these very Anodynes themselves may be somwhat varied according to the quality of the humor; and in a humor that is more hot there may be added some certain things that are cooling, as *Roses*, and the *Water* that cometh from them, *Plantane Water*, and the like. But in a cold Cause the *Flowers* of *Camomile* and *Melilote*, *Wormwood*, *Linseed* and *Fenugreek* may be added.

Narcoticks.

If Anodynes be not sufficient for the aforesaid purpose, then Narcoticks are to be made use of; which in regard that they bring a certain kind of numness upon the part, they do not only forthwith assuage the pain; but they likewise (by their heat which they obtain) do also withal resolve the humors, and so with benefit and safety (and without any danger at all as it is thought) they may be made use of, as *Platerus* writeth in the 2. *B.* of his *Practice*: and therfore he (as likewise many others have done) much commendeth the Leaves of Henbane, and Mandrake, and Poppy, if while they be new they be first bruised or boyled, and so laid upon the part: and their Oyls are also very useful; and so is the Juyce also that is pressed forth of them and used for a fomentation; as likewise the Root of Mandrake and Henbane seed applied together with other things in the form of a Cataplasm. The new and fresh Leaves likewise of Tobacco, bruised and laid upon the pained part do assuage the pain. And the same *Platerus* (as likewise other Authors) have here recourse unto *Opium* also, and they mingle it together with other Anodynes; and unto two ounces of these they add a dram of *Opium*. And he writeth also, that if it be dissolved in the infusion of the Spirit of Wine alone, or the infusion of Saffron (four ounces of the yelloweſt of it) and one scruple of Camphyre with a dram of Opium, and the part where the pain is be wel washed or bathed with the said Liquor, it is a most efficacious and soveraign Remedy. And so likewise the Opiate Antidotes, as Treacle, Mithridate, Philonium, may be added while they are new, especially in case the quantity of the Opium may be augmented. *Narcoticks.*

And yet notwithstanding we are not to continue long in the use of these Opiates, in regard that they are enemies unto the native heat, and Nerves.

And yet nevertheless the same *Platerus* tels us (in the first *B.* of his Practice, Chap. 5. of the hurting of the Touch) that he could never find that the Skin could be made stupid and senseless of pain by any external Narcotick applied thereunto, albeit (that so he might know somwhat of a certainty) he had applied a Mass of Opium when he had first softened it, unto the part pained with the Gout.

But the truth indeed is, that Narcoticks when they are administred do very easily assuage the pain; but then withal it being so that they hinder the motion of the humors unto the external parts, they may also very easily cause some inconvenience, and make the pain longer, since that the pain is wont to return again in a short time after. As for example.

Take *Barly Meal four ounces, the Crumb of Wheaten Bread three ounces, Milk as much as will suffice: boyl them to the consistence of a Cataplasm; and then add of the Oyl of Roses one ounce, the Yelks of three Eggs, Opium one scruple, and mingle them.* Or,

Take *the soft pith of white Bread as much as wil suffice; pour thereon of Cream of Tartar a sufficient quantity, and then add Saffron one dram, Frankincense half a dram, Powder of Earth-worms two drams, the Yelks of four Eggs, Henbane and white Poppy seed, of each three drams; let them boyl in a double Vessel for half an hour, and make a Cataplasm.* Or,

Take *Leaves of Henbane three handfuls, the Berries of Nightshade one ounce; let them be boyled til they be soft, and then bruised to a Mash; then strew upon it one ounce and half of Barly Meal, and a little Oyl of Roses, and so make a Cataplasm.* Or,

Take *Barly Meal, the soft Crumb of white Bread, of each half a handful; Leaves of Henbane, Mallows, Violets, of each one handful; Flowers of Camomile, Rindes of white Poppy, of each half a handful; Oyl of Earth-worms, and Poppy, of each one ounce, and make a Cataplasm.* If you think fit you may also add of *Opium* and *Saffron*, of each one dram.

Or, Take *Roots of Mandrake, and Leaves of Henbane of each as much as you think wil suffice; boyl and bruise them all to a Mash, and then add of Barly Meal, and Bean meal, with Oyl of Roses, a sufficient quantity of each, and make a Cataplasm.* Or,

Take *Crude Vitriol two pound, Spirit of Wine three pints, the Water of the Elder Tree one Quart.* Mingle them all well together in a Glass Vessel well Luted, and then puting to the Alembick, and the Receiver (in which there may be put the *Seeds of Henbane bruised two ounces, the flowers of Mullein, Elder, and Camomile, of each two handfuls*;) let there be a destillation, by degrees, until the Glass be Fire hot. After the distillation, let the spirit with the flegm be separated from the Seeds and flowers; and so let it be kept in a Glass for use. Or,

Take *Leaves of Henbane one handful, Nightshade, Sengreen, the Heads of Garden Poppyes, of each half a handful, Mandrake Roots one ounce, Flowers of Camomile and Mulleyn, of each one pugil, Seed of Fleabane one ounce and half, of Henbane one dram*: Let them be boyled in Milk for a Fomentation; then let the Remainders be bruised to a mash; and then add of the *Meal of Lin-seed one ounce, Barley Meal and Oyl of Roses, of each two ounces*; and make a Cataplasm.

And there are some also that refer hither the washing of the grieved part with cold Water; and indeed this they do by the authority of *Hippocrates*, who in his 5 *Sect.* 25. *Aphorism*, writeth in this manner: *The Gout pains of the Joynts, as also Convulsions, and many more of these kind of pains are lessened and taken away by the large affusion of cold Water, and plentiful pouring of it upon the part that is in pain: for a Moderate stupifying and benumming removeth the pain.* And so likewise *Donat. Antonius Ferrus* (in his 2 *Tract of the Gout, Chap.* 9.) writeth that he had oftentimes had experience of this Remedy; and that when all other Remedies were to no purpose, he betook himself unto the pouring of cold Water upon the part, as unto his last shift, and that the pain was forthwith asswaged thereby. And the very truth is, that it cannot indeed be at all denied, that cold Water being poured forth upon the pained part doth not only drive back, but likewise produce a kind of stupidity and benummedness, and thereby asswage the pain: but it is to be feared lest that by this means the innate heat of the part be destroyed, and so a weakness brought upon the part, by reason of which the Malady may afterward be rendred more grievous, and moreover the Humor may be impacted into the part, and there condensed and thickned; or else haply by this violent Repulse the Humors may be made to rush unto the more inward parts.

Repellers, or *Medicaments that drive back.*

Repellers. But now as for Topicks, (that are directed unto the Cause) and in the first place, touching Repelling Medicaments we say, that although they are by some commended; yet alone they have here scarcely any place at all. For seeing that Nature her self hath ordained this Motion, and that she endeavoureth to drive forth the vitious Humors from the more internal unto the external parts that are less noble, if this motion be hindered, and the Humors driven back again unto the internal and more noble and principal parts, this cannot be done without the extream hazard of the life; and hereupon there will arise the worst and most dangerous Symptoms, that will not cease, unless Nature again expel forth the vitious Humor unto some other Joynt.

And moreover, when the pain is a little mitigated, in regard that the matter is diffused unto the external parts that are about the Joynt, if by the Repellers it be driven back unto the internal parts, the pain happeneth then to be increased; and hence it is also, that very many cannot so much as endure the cold Air from without (neither yet sometimes the external Air although it be not so very cold) but that there is a Necessity of covering the affected Member, if they expect to have their pain Mitigated. And furthermore if the matter hath already flown out of the part into the Joynt, by the use of Medicaments that drive back and Cool it is made more thick and impacted into the part, and so the Malady rendred more difficult to be cured. But yet nevertheless if by the sudden and overgreat afflux of the humors (especially such as are more hot) the pain be much increased even in the very first beginning of the fit, (in so much that it seemeth to cal for all the Care, and to require that al the means that are used may be for the removal thereof, and that therefore we have a mind to moderate it, and somwhat to drive it back) we may then indeed make use of Repellers, but not of them alone and by themselves, but mingled with Anodynes, Venesection and Purgation having gone before. Like as on the Contrary, we

are

are not in the beginning to make use of those Medicaments that are over loosening, since that they help forward the afflux of the Humors; but we ought in the first place to make use of those Medicaments that do somwhat stop and stay the afflux of the Humors. And therefore we may then lawfully add *Lettice, Sengreen, Purslaine, Violets, Plantane, Roses,* (and such Compounds as are made out of them) as also what *Vinegar* we think fit. As,

Take *Barly Meal three ounces; boyl it in Oxycrate; then add the Yelks of two Eggs, Saffron one scruple,* and mingle them. Or,

Take *Mucillage of the Seed of Fleabane, extracted with Rose Water, two ounces; Mucillage of Marsh-Mallow Seeds one ounce, Barly Meal as much as will suffice, the yelk of one Egge, and so make a Cataplasm.* Or,

Take *The water of the Sperm of Frogs four ounces, Water of Nightshade, of the flowers of Elder, and of Plantane, of each two ounces; Camphire half a scruple:* and mingle them well together.

If you think fit, *the Mucillage of the Seed of Fleabane, and of Quinces, of each one ounce, may be added.* Or,

Take *Juyce of Henbane, Sengreen, Lettice, of each two ounces, Barly Meal one ounce, the Yelk of one Egg, and Oyl of Roses two ounces.* Mingle them well together. Or,

Take *Red Roses one handful, the Meal of Fenugreek Seed, Beans, and Barly, of each one ounce, Red Sanders one dram and half, Camomile flowers one pugil; when they are boyled and throughly bruised, you are to add the Yelks of two Eggs, Vinegar four ounces, Oyl of Roses as much as will suffice:* and make a Cataplasm. Or,

Take *Water of Night-shade, of Plantane, of the Sperm of Frogs, of each two ounces, Oyl of Roses and Camomile, of each one ounce, Cows Milk three ounces, the Meal of Beans, Marsh-Mallows, and Barly, of each one ounce, or as much as will suffice, Saffron one scruple, the yelks of two Eggs, Smallage two scruples;* Make a Cataplasm.

Some there are that steep *Harts-horn burnt and prepared in the Water of Mulleyn flowers;* or else they boyl it in the same Water; and in the streyning they wet and soak Linen Clothes, and these they lay upon the part that is pained. Or,

Take *Mulleyn new and fresh gathered six pound, Wine one Quart:* Let them be Macerated for three whole daies, and then afterwards let them be destilled. Or,

Take *The Flowers of Mulleyn, and fill a Glass bottle ful of them, and then stopping the mouth thereof very close, set it in the Sun: for so they dissolve as it were into a liquor: wherein you are to wet a Linen Cloath, and lay it upon the part affected, for the asswaging of the pain.*

If you judg it fitter to make use of Oyls; Then,

Take *Frogs five of them in Number, Earth-worms washed in Wine three ounces; boyl them in the Oyl of Roses, and strain them.*

Discussing Medicaments.

Discussives.

But now when the force and violence of the fluxion is once past and gone, and the part become swoln, then those things are withall to be mingled which do cal forth the Humor, and gently discuss the same and so take away some part of the Cause. But now here Physitians are wont (for the most part of them) to be very long and Tedious in reckoning up, and distinguishing the several Medicaments; which of them are fit and proper in a hot Cause, and which of them when the Cause is cold; yea and which of them are most convenient for all kind of Humors. But although we deny not but that we are in some kind of manner to have respect unto the Condition of the Humor that floweth in unto the Joynts; yet nevertheless our chief and main Care ought to be, that the serous and sharp wheyish Humor (which is the nighest and most principal Cause of the pain,) may be called forth of the more deep and close parts in the Joynts unto the external parts, and that they be insensibly discussed; and yet that this may the more conveniently be so done, we may likewise (as we said but now) have some regard unto those Humors that the aforesaid serous and sharp Humor forcibly draweth along with it, and which by Reason of the pain are together attracted to the part that is pained, and which are very commonly taken for the nighest and most immediate Cause of the Gout. Yea and

moreover that very ſerous Humor it ſelf (the prime and principal Cauſe of this Evil) is in ſome more, and in others leſs hot. And therefore if the flowing Humor be more hot, then the diſcuſſing Medicaments ought to be ſo ordered, that they may indeed gently diſperſe the Humor; but yet ſo that they give no occaſion at all for any new afflux. And ſuch a like hot Humor, inregard that it is withall moveable and thin, is eaſily diſcuſſed; neither needeth it any ſtronger Medicaments. But if the Humor be leſs hot, or ſomwhat cold, then we may very ſafely adminiſter Medicaments that are more hot. Neither will there be any Cauſe to fear that then a new flux may eaſily be excited; and therefore for the diſperſing of ſuch a like Humor there are neceſſarily required ſuch Medicaments as are more hot then ordinary.

But now with what Medicaments that wheyiſh, and (as it is ſo called by the Chymiſts) Tartarous Humore is to be drawn forth and diſcuſſed, we are here (and that for very good Reaſon) diligently to make inquiry. For we have elſwhere told you (viz. in our Tract of *Chymic. Conſil. & Diſſ. Chap.* 15.) that the Medicaments ought in their own kind to be like unto the Cauſe. For there is not any thing that ſuffereth from every thing; neither is there any thing that may be united unto every thing. Gum Arabick, and Tragacanth, and the Gum of Cherry Trees are diſſolved by Water, becauſe of the neer alliance and agreement in their Natures; but but ſo is not Sulphur, and other things of a Sulphurous Nature, and thoſe things that are Oyly. Sulphur is diſſolved by Oyl, but not by *Aqua Fortis*, although the ſaid Water is able to diſſolve ſilver, and other Metals. The hands when they are all foul with Pitch or Turpentine are not to be made clean with Water, but with Oyl, or ſome thing elſe that is fat. In burnings we uſe not to adminiſter cold Water; but Linſeed Oyl, Verniſh, and the like (that may draw forth that fire and burning) are to be applied. And ſo in the *Eryſipelas* (or otherwiſe called *Roſa*) we ought not to impoſe thoſe things that are fat, and Oyly, but ley tempered with Oyl; and Sope that is diſſolved in Elder Water, and the Like; which do not at al ſhut the pores, but yet nevertheleſs they draw forth and diſcuſs that ſubtile and hot Humor. And the very ſame is the caſe in the Gout; and ſince that it hath its Original, not from a Watery Humor, neither yet alſo from that which is Oyly or Sulphurous (as the Chymiſts ſpeak) but from a Humor that is ſharp and Salt, for the drawing forth and diſſipating of this Humor, thoſe things that contain in them a volatile and flitting Salt are rather to be adminiſtred, then thoſe things that are fat and Oyly. And experience hath already taught many, that the Gout pains are increaſed by ſuch things as are fat. And hence it is that the Chymiſts do ſo much commend (and not without cauſe) *Salt Armoniack*, oftentimes ſublimated, diſſolved in Wine, or ſome other convenient liquor, and ſo impoſed upon the pained part. Others commend the Salt of Urine, in like manner diſſolved in Wine, or ſome other liquor. And whereas *Adrian Spigelius* writeth that he ſaw when a Mans Urine (being kept till it was Stale) was laid upon the part affected (the pains as yet abiding, and continuing even in their heighth) and that it was wonderfully beneficiall in giving eaſe; and how much rather then muſt the Salt of Urine perform this? Yea and there are ſome that uſe likewiſe other Salts to evacuate the aforeſaid Humor. And I my ſelf know alſo one that was wont to adminiſter the ſpirit of Salt tempered with other liquors, And very fitly may it be tempered with the *Water* of *Meadowſweet*; for being then with a Feather laid upon the part in pain, it extracteth the Humor in ſuch a manner, as that it may even ſeem to exhale in the likeneſs of a Vapor. Yea ſome there are that commend alſo thoſe things that are wont to be made uſe of for the cauſing of redneſs in any part, and the raiſing of bliſters when there is occaſion; and theſe they mingle with *Anodynes*. Neither are theſe things the inventions of the latter Phyſitians, and the Modern Chymiſts; but that plants abounding with a volatile and ſharp Salt were heretofore in uſe likewiſe with the Ancients, for the curing of the Gout, we are taught even by that one plant which we call *Lepidium* or *Sciatica Creſſes*; whoſe Roots (as they write) being bruiſed, and mingled with old Greaſe, are (with ſingular benefit) applied unto thoſe that are troubled with theſe pains of the Gout; as it appeareth out of *Dioſcorides*, and *Damocrates* (whoſe verſes upon this ſubject we may read in *Galen* his 10. *B. of the Compoſition of Medicaments according to the place*) and *Aetius*, *Tetrab.* 3. *Serm.* 4. *Ch.* 2. and others. And as touching Muſtard Seed, *Alexand. Tralleanus* writeth,

writeth, That he knew a certain person who by the use only of the said Mustard seed mingled with dried Figs (in extraordinary great pains arising from a cold Humor) was freed from the said pain of the Gout. Some commend the wild Radish throughly bruised; and I my self have seen that it hath done good to many. If we fear its Acrimony, and that from thence some heat may be excited, we may then first boyl it a little.

The Liquor of Snails is likewise very much extolled by some: as,

Take *Snails taken forth of their Shels, in number twenty five: the berries of Danewort or Dwarf-Elder, and Salt, of each as much as will suffice.* These being put into the Alembick in a clean Vessel with holes through the bottom thereof, let there be a Vessel put under it that may receive the Liquor as it distilleth; in the which you are to wet cloaths, and apply them unto the part affected.

This Suffumigation is likewise much commended.

Take *Lign. Aloes, yellow Amber, Frankincense, Gum Juniper, Henbane seed, Styrax Calamite, Gum Tacamahaca, of each one dram*; Pouder them grosly, and cast the pouder upon live coals of fire; and so for half an hour let the part affected receive the smoak hereof. *Quercetan* (in the seventh Chapter of his *Pharmacop. restit.*) hath four Waters, al good against the Gout. The first is this:

Take *Water of the Sperm of Frogs, of white Mullein, and Sallow, of each a quart and half a pint: the Urine of a Boy that drinketh Wine, three pints: Treacle new and fresh two drams and half: Vitriol, Salt dissolved, and Allum, of each four ounces: Let them be distilled (till they be dry) upon the Embers: then add Salt of Vitriol one ounce and half: Camphire and Saffron, of each two drams, and mingle them.* Let Linen cloaths be throughly wet in this Water, and applied unto the grieved part, and be very often renewed.

The Second Water is this:

Take *Salt, Urine of a Child, of each as much as you think fit, and then distil them.*

The third is this,

Take *Leaves and Flowers of green Elder, of each one pound: let them be well bruised and macerated in a sufficient quantity of Wine (for three daies together) in* Balneo, *and afterward let them be distilled.*

The fourth Water is this:

Take *Spirit of Wine rectified one quart; the purest Honey one pound:* Let *them be distilled in* Balneo; *and let two Liquors be gathered from hence severally and apart, to wit, One watery, and the other Sulphureous. Add unto the remainders, of whol Saffron one ounce and half; Venice Turpentine two ounces; Tartar calcined to a whiteness half a pound; Salt one ounce; the flegm of Vitriol four ounces; Lye made of the tender shoots of the Vine two pints: Let them be macerated for twenty four hours, and then distilled till they be dry. Unto the feces that remain add the first Water, and let them be distilled. And at length mingle together all the Liquors, and distil them in a* Balneum *where they may evaporate.*

Andreas Libavius (in the first part of his *Apocalyps. Hermet. Cap.* 8.) preferreth before all others that Water in which Brass and Iron have been extinguished, and afterwards *Mercurius vitæ* hath therein been macerated. Or,

Take *venice Soap one ounce and half; Spirit of Wine, Water of Elder Flowers, of each two ounces, and mingle them.* Or,

Take *River Crevishes eight in number; Juniper grains one handful; Myrrh and Frankincense, of each one ounce; the best Wine one pint, let them be distilled.* Or,

Take *Mastick, Frankincense, Myrrh, Ammoniacum, and Bdellium, of each two ounces; Vitriol one pound; Honey a quart, Tartar an ounce and half; Spirit of Wine the best, four pints; let them be distilled according to art.*

Solenander (in his 24. *Consil. Sect.* 5.) writeth, That he knew an old man that was much troubled with the Gout, who made for himself a Medicine in this manner. When there was a swelling, and a real pain, and the place red, he took Salt, Cinders, the Urine of a Child, and Vinegar; in these (wel mingled together, and stirred up and down) he throughly moistened a white woollen cloth, and then squeezing it he applied it now and then unto the part that was pained. And when he had now by this means in great part asswaged the pain, and the disease declining, he boyled live Sulphur, and the pouder of white Hellebore in the Oyl of Linseed, and with it he anointed the places affected. And the same *Solenander* writeth also that this following was known to benefit many that made trial thereof. There groweth unto the Roots of the Oak (in the Autumn for the most part) a certain kind

kind of Mushrom that is red and tender, and proportionably big enough, according to the growth of the Tree, which he therefore calleth *Hypodrion* (the same no doubt that we have made mention of above in our 3. *B.* of *Practice*, *Part.* 2. *Sect.* 2. *Chap.* 7. touching the *Dysentery*:) this when he hath cut it into many smal thin slices, with Salt finely poudered he puts it into an Earthen pot; so sprinkling the aforesaid Salt that every laying of the several pieces may receive some thereof betwixt each other: he then puts them deep in the Earth for certain daies; and as for the brine which at length he findeth melted in the pot, he gathereth it all together, and this he keepeth to anoint the joynts when they are pained. But because that it vehemently drieth and discusseth, and wonderfully strengtheneth the part that is made loose by the Humor, he tels us therefore, that it is best to use it in the very first beginning of the pain, and before it hath gotten unto any heighth; or else in the end and declining of the Paroxysm, to consume the matter, and to add strength and firmness unto the part; and more especially if there be now and then interposed a fomentation and washing of the parts with the Decoction of *Mulleyn*, *Wormwood*, *Camomile*, *Bears-ears or French Cowslips*, *Sage*, *Ground-pine or Herb Ivy*, *Mugwort*, *Rosemary*, *Melilot*, and others of this kind, that have a power to cut, cleanse, discuss, meanly to dry, and strengthen.

And this Plaister is likewise very much commended.

Take *Gum Caranna one ounce and half*, *Gum Tacamahaca six drams*, *the Oxycroccum Emplaster*, *nine ounces*, *White Wax five drams*, *Powder of the greater Confound two drams*. *With the Oyl of Camomile make an Emplaster according to Art*; *which being applied unto the pained part doth greatly draw forth the matter*, *and ease the pain.*

And of such Kind of Medicaments as these there are many more in great abundance to be found in *Platerus* his second Book of Practice, and elswhere in others.

And yet notwithstanding I think it not amiss, here to give you notice of this, that in the applying of all manner of Topicks we are diligently to heed the signs of those that benefit, and those that hurt and offend. For albeit the nigheſt Cause of the Gout be a wheyish, salt, and tartarous humor (or cal it by what name soever you please) yet nevertheless it is not for nothing that the Chymists give us notice (as we shal further shew you below in the *sixth Question*) that there are in the Earth and Plants divers kinds of Salts; or as *Platerus* speaketh, that the humor the Cause of the Gout is mingled with the *Ichores* of the excrementitious humors, which render the same more vehement and violent. And hence it is, that not only in divers and several Persons, but likewise in one and the same Person, according to his several ages, the nature of the pain is different, and not evermore one and the same.

And then laſtly, for the discussing of the Reliques and Remainders there may be made fomentations of Mugwort, Organy, Wormwood, Betony, Calamint, Flowers of Arabian Stœchas, Lavender, Camomile, Melilote, boyled in Wine and Water, which withal strengthen the part. But here *Crato* doth rightly advise us (in his *Consil.* 240) that we wet the Feet as little as may be, but that the vapor be only received by the Feet. And indeed such like fomentations are most convenient. And yet notwithstanding if there be a few more Plants boyled in the Water, and a little salt added; or else if a *Lixivium*, or Ley, be poured thereunto, there is no discommodity to be expected from the humectation; or if we do at all fear any hurt, left that the wateriſh humidity should after the bath be left in the part affected, the following Trochisks may be cast upon the Coals of Fire, and the smoak received by the part affected.

Take *Gum Juniper*, *and Frankincense*, *of each two drams*; *Ladanum and Benzoin*, *of each one ounce*; *Cinnamom*, *Cloves*, *and Nutmeg*, *of each half a dram*; *make them into a Powder*, *and incorporate them with Gum Tragacanth*; *and then make Trochisks thereof.*

There is likewise very much commended a Bath of Juniper Wood, as also of the Decoction of a whol Fox, adding thereto Frogs and Earth-worms, and the Herbs before recited.

Or else let the Feet be anoynted with some convenient Liniment or Unguent. *Galen* (in his 2. *B.* of simple Medic. Chap. 18.) as likewise many other Authors, do much commend the Chafing and Rubbing of salted Oyl into the part affected. For in all those (saith *Aetius tetrab.* 3. *serm.* 4. *Cap.* 21.) that are chafed in this manner, the Natural innate heat is augmented, that which is preternatural is dispersed, the Excrements are consumed, and the affected Members are rendred more strong, so that they are no further obnoxious and subject unto pains; especially, if from day to day all their whol life long they be diligent in the use

uſe of this Remedy every morning and evening. Touching which *Philagrius* very confidently (and without doubt Hyperbolically) is bold to pronounce (as *Aetius* writeth in the place alleadged) that even this one Remedy alone is ſufficient for them that either moſt of all tranſgreſs in matter of Dyet, or ſuch as are immoderately cooled, or ſick with over hard labor, or ſuch as have been exceſſive in the uſe of Venery, or ſuch laſtly as have run into any other error and exceſs. But now becauſe that the Oyl and Salt are not eaſily mingled, the Salt is firſt of all to be moiſtened in hot Wine, and afterward in a Mortar to be diligently mingled with the Oyl; and alwaies before this Liniment be put unto uſe, the Salt is throughly to be mingled with the Oyl. Neither is it ſufficient only to anoynt, but the Joynts are alſo to be wel rubbed, that ſo the force and virtue of the Medicament may the better penetrate.

Take *Caſtor and Frankincenſe of each one dram and half, Marrow of a Hart, the Fat of a Gooſe, of each three drams: Oyl of Maſtich and Mints, of each two ounces and half: Bdellium and Galbanum diſſolved in Vinegar, of each half an ounce: the meal of Linſeed, and Fenugreek, of each three drams and half: Wax as much as will ſuffice, and make a Cataplaſm.*

The Remedy of *Flavius Clemens* (by the uſe of which, as it is reported, men that have been deſtroyed in their whol body by the Gout *Podagra* and *Chiragra*, have been ſo well recovered that they have walked without any hurt or hinderance) is deſcribed by *Galen* in his 7. *B. of the Compoſit. of Medicam. according to their kind, Chapt.* 12. (where he hath alſo other Receipts of this Nature) and ſo likewiſe in his 10. *B. of the Compoſit. of Medicaments according to the place, Chap.* 2. Or,

Take *Gum of the Pine Tree one ounce, black Pitch two ounces, Wax one ounce and half: the fat of an old Cock two ounces, pouder of Hermodactyls, and live Sulphur, of each three ounces: Let there be an Emplaſter made thereof, and renewed the third day.*

Theſe Remedies immediately following are preſcribed by *Henricus Stapedius* (in *Conſil. Scholtzii, Conſil.* 238.)

Take *Juniper berries, and Marſh-mallows, of each two ounces: the Leaves of Lawrel, Myrtil, Sage,* Betony, *Caſſidony, or French Lavender, Organy, Calaminth, Marjoram, and Roſemary, of each of theſe half a handful: Linſeed and Fenugreek, of each two ounces: Make a Decoction in the Lye of the tender ſhoots of the Vine, adding thereto of common Salt one pound.*

Afterward let them be anointed with the following Oyl.

Take *Roots of Pellitory, Nutmeg, and Cloves bruiſed, of each two drams; Flowers of Sage, Hyſſop, Roſemary, Arabian Lavender or Caſſidony, and Spicknard, of each one dram and half; the Root of* Birthwort, *and Hermodactyls, of each one ounce: pour in hereunto of the Spirit of Wine one pint, or as much as wil ſuffice; let them be macerated for one whol day; and afterwards add of the beſt Turpentine one pound and half; and ſo diſtil them in a glaſs Alembick.*

Alexander Trallianus and others commend this; and they aſſure us that by it not only ſuch as have had the Gout from the flowing of a flegmatick Humor, but that likewiſe many that have had the pains of the Gout from the flux of a Colerick humor, have recovered their health and ſtrength again.

Take *Time, Organy, Savory, and Calaminth, of each as much as you think fit; and boyl them in the ſharpeſt Vinegar; and with the hot Decoction often waſh and foment the parts affected.*

For the Knobs or Knots.

For the Knots in the Joynts

If the matter be now grown into the wonted hard Knobs, it is indeed a moſt difficult buſineſs to diſſolve them; but if they be not already become old and inveterate, there may be yet ſome hopes left of curing them. Now for the diſcuſſing of theſe knobs and knots we are not only to adminiſter External and Topick Remedies, but likewiſe Internal Remedies. The Internal Remedies are thoſe Antidotes above mentioned, amongſt which the Antidote of *Trallianus* (made of Centaury) is more eſpecially uſeful. And the ſame *Trallianus* writeth likewiſe, That a certain perſon troubled with the Gout, when the knots began firſt to appear, by the drinking of the Decoction of Groundpine or Herb Ivy, he prevented the further generating of them. External and Topick Remedies (uſeful for the diſſolving of the Knobs) are *Ammoniacum* diſſolved in Vinegar. Or,

Take *the ſimple Diachylon Emplaſter one ounce; Ammoniacum, Galbanum, Bdellium, Sagapenum,*

Sagapenum, of each one dram, Oyl of Orrace, and white Lilyes, of each half an ounce, powder of Orrace one dram, and make an Emplaſter. Or,

Take *Briony Roots, Wilde Cowcumber, and Orrace Roots, of each two ounces, Roots of Marſh-Mallows, and white lilies, roaſted under the hot Embers, of each four in number; the Seed of Nettle, Muſtard, and Water Creſſes, of each one ounce.* Let them all be wel mingled, and ſtird about together with *Gooſe Fat,* and the *Oyl of ſweet Almonds,* as much as will ſuffice, and make a Cataplaſm.

Galen and others do much commend that which is made of old Cheeſe: for the Skin being broken and divided of its own accord, without any Section, it refreſheth and comforteth the Joynts that are from day to day (without any hurt at all) freed from the Stones. *Viz.*

Take *Old and tart Cheeſe, three ounces, or as much as you think fit; dip it in a ſufficient quantity of the broth of Salt ſwines fleſh, and then after you have ſufficiently pounded it in a Mortar, let it be impoſed upon the part affected. Others boyl the Salt Feet of Swine in water, until they be very ſoft and tender, and afterwards they mingle with them of old Cheeſe two parts, and Water Creſſes one part, and ſo they make an Emplaſter, which they greatly commend.* Or,

Take *Juyce of Tobacco three ounces, Citrine Wax two ounces; Roſin of the Pine Tree one ounce and half, Turpentine one ounce, Oyl of Camomile as much as wil ſuffice:* and make a ſoft Cerote. Or,

Take *Honey, Bears Greaſe, and ſharp Vinegar, of each one pound or pinte, Mountain Snakes, and Snailes, one or two of them; boyl them in a Glazed Veſſel over a ſoft fire, until the Vinegar be conſumed; afterwards ſtrein them, and add of Wax three ounces.* Let them then beal diſſolved together, and kept for uſe; and with this the place affected is to be anointed, by the fire ſide.

The Dirt that is found in ſome certain Baths (having in them a power to Mollifie and Reſolve) are here likewiſe very uſeful; (ſuch as are thoſe of *St. Peter,* and *Bartholomew,* in the province of *Padua*) with which the part affected is to be fomented for an hour, and better, every Morning and Evening, and afterwards to be waſhed with the Bath-Water.

Eraſiſtratus Sicyonius provided this excellent and effectual Remedy againſt theſe knobs and knots.

Take *Oake Miſsletoe, one pound and half, Frankincenſe, Wax, Fat Torches, and Roſin of the Pine Tree, of each one pound.* Thoſe things that were diſſolveable he melted, and ſtird them wel about, throughly mingling them with the Fat Torches; from the which when all the Fat was flown forth, he took the Liquor from the fire, and ſtrained it, and then beating the Frankincenſe into a very fine powder he put it thereunto; dayly ſtirring it about, until he had brought it into a Maſs that would not foul, or ſtick to his Hands. See more of this in *Trallianus* his *Eleventh B.*

Chap. 6. *Of the Sciatick Pain.*

The Sciatick Pain.

THe pain of the Hips (commonly called the *Sciatica*) in indeed a kinde of the Gout; ſo that there may nothing ſeem needful to be ſpoken as touching it, beſides what hath been already ſaid. But ſeeing that both in regard of the part affected it hath ſomthing peculiar, and that in the Cure there is ſomething that is proper thereunto to be obſerved; we ſhall therefore ſpeak a little further thereof.

There are indeed ſome, who by the *Iſchiadick* or *Sciatica* pain underſtand ſome other affect, differing from the Gout, (which is to be accounted among the Chronical affects) and this happeneth alſo unto thoſe that never were troubled with the Gout, either in the Feet, or in the hands, from excrements there heaped up together, or flowing into that part, and this for the moſt part a little now and then, and by degrees. But it is not our purpoſe here to treat of that affect; in regard that it pertaineth unto the impotency and inability in walking, by reaſon of ſomething amiſs in the Hip; (and extendeth it ſelf further then the Gout; of which only our purpoſe is here to Treat;) and therefore we ſhall here handle the *Sciatica* pain,

only

only as it is Arthritick, that is to say, a ſpecies or kind of the Gout, of which we have been hitherto ſpeaking.

But now as touching the place affected, there is here ſome kind of Diſagreement among the learned Phyſitians. *Aetius* (*Tetrab.* 3. *Serm.* 4. *Chap.* 1.) out of *Archigenes* writeth thus: *They are properly* (*ſaith he*) *to be accounted Iſchiadick or Sciatick perſons, that have a pain afflicting them about ſome certain Joynt of the vertebræ. But ſomtimes there goeth before this Malady,* (*and as it were, to Uſher it in*) *a pain of the Muſcles lying neer, and eſpecially the Loyns; but ſomtimes again the beginning of the affect is from the very Joynt it ſelf: but now ſomtimes it ſo happeneth that the pain of the Vertebræ being almoſt taken away, the grief ſticketh only about the Ham, and in ſome neer unto the Ankles, but in others the whole Leg is equally afflicted with pain; and many alſo have this pain fixed about their Groyns, and then indeed the grief and trouble being derived unto the very bladder produceth a difficulty of making Water; and then moſt eſpecially it is that the whole Leg, from the Hips* (*even unto the very Heel*) *ſuffereth Pain.*

Fernelius (in his *Sixth B. of the Diſeaſ. of the parts, and the Symptoms, Chap.* 18.) ſaith, *that the Iſchias or Sciatick pain* (*being abſolutely the moſt vehement of all the reſt*) *hath not its ſeat in that Joynt by which the head of the Thigh is inſerted and faſtened into the Hip, but deeper, at the utmoſt of the Buttocks, by which the Nerves that proceed from the Loyns and the great bone, called Os Sacrum, or the holy bone, are carried into the Thighs; the great and terrible pain is not in the Hip alone, but it is likewiſe extended into the Thigh, and into the Calve of the Leg, and unto the extream part of the Foot, to wit, whitherſoever that branch that is derived from the Hip affected reacheth and extendeth it ſelf.* But ſome other, (as *Platerus*) attribute the Sciatick pain unto the Joynt, with the Thigh.

But here we are to underſtand, that about the Hip (as alſo now and then in the ſhoulder) there happeneth ſomtimes a pain, which is indeed very often moſt vehement, and yet nevertheleſs it is not properly a pain of the Joynts, in regard that it is not in any Joynt, becauſe it ſeizeth upon the Membrane of the Muſcles; neither again doth it conſiſt alwaies in one and the ſame place, but for the moſt part deſcendeth downward unto the inferior parts. And ſuch almoſt is that Iſchiadick pain that *Aetius* hath deſcribed out of *Archigenes*. And I grant that this pain hath its original from the Serous and ſharp Humor that floweth from the Head under the Skin, and ſticking about ſome Membrane, or ſome Nerve: but now, that this pain is not properly the Gout, appeareth from hence; Firſt, becauſe it conſiſteth not alwaies about the Joynts, but alſo in the middle ſpaces within the Joynts. And ſo I have here Cured a perſon of honor, that ſuffered ſuch a pain in the very Muſcles themſelves that are between the Knees and the Hip. And the like pains often happen in the Breaſt, and there excite a certain baſtard Pleuriſie. And then Secondly, becauſe that they very rarely return by intervals, and conſtantly at ſome certain times; but often after they have afflicted a man once or twice, they return no more afterwards all the whole life long. Thirdly, becauſe thoſe that ſuffer theſe pains are not afflicted with the Gout in any other parts, which happeneth in the true Gout, and that is properly ſo called. For thoſe that are long troubled with the Gout are very ſeldom afflicted with the Gout in the Feet alone; but they afterwards ſuffer pains likewiſe in their Hands, and their other Joynts.

And Laſtly, likewiſe the true Gout (for the moſt part, if not alwaies) hath a Tumor or ſwelling Joyned with it; but now theſe pains have no ſuch ſwelling Joyned with them; not only when they are in a deep place, but alſo when they are in a place that is not deep; as it often happeneth in the ſhoulder; and this cometh to paſs for this Cauſe, to wit, that the Humor floweth not out of thoſe Veins by which that part is nouriſhed, as in the true Gout.

But we intend not here to treat of that pain, but only of that which is properly the Arthritick or Gout pain. But now that *Iſchiadick* or *Sciatick* pain hath this proper unto it, that it is diffuſed more abroad then in the other Joynts, and oftentimes unto the places that lie next: and this happeneth, firſt of all, becauſe that the Hip bone is large; from whence it is, that we diſtinguiſh it by three names; and when it is knit unto the ſides of the *Os Sacrum*, we then cal it the *Ileum* bone; when unto the hollow part of the ſaid bone, we then call it *Iſchium*; and when it is Joyned with the forepart, we then call it *Os Pubis* or the ſhare bone. And then Se-

condly, becauſe that the Nerves that come from the Loyns and the *Os Sacrum* to that Articulation, are diſtributed into divers parts: and therefore the pain of the Hip doth ſomtimes diffuſe it ſelf into all places, and reacheth even unto the Nerves that are derived from the Hip.

But now this Malady is very difficult to be cured, by Reaſon of the deepneſs and largneſs of the place, and the abundance of the matter which the wide Place receiveth. *They who being infeſted by a long continued pain of their Hips have the Hip-bone fallen out of its place, and again returning into its place, theſe have a filthineſs and naſtineſs following thereupon*; (*in the ſixth Section, and* 59. *Aphoriſm.*) For if by the Humor flowing in the Ligaments be relaxed, the Hip falleth out of its place; and the Humor that is gotten into its Cavity is made dul and thick; yea and oftentimes it groweth there into a ſtony hardneſs; whereupon becauſe the Veins and Arteries are moved out of their proper places, and are preſſed down together, thence it is that an Atrophy followeth in the Legs. And if this Iſchiadick pain invade any one in the time of youth, it threateneth the ſhortning of the life, becauſe that by pain and hunger the ſick perſon waſteth and withereth away; and from hence likewiſe the *Iſchiadick Conſumption* hath taken its Name.

As concerning the Cure, for Revulſion, the *Baſilick* Vein in the ſame ſide is moſt fitly opened; but the *Iſchiadick*, if it be for derivation. And indeed if the pain extend it ſelf more externally, that Vein that is in the outward Ankle; or the *Saphena*, which is at the inward Ankle, if the pain tend more inwardly.

And *Hippocrates* likewiſe (6. *Epid. Sect.* 5. *Text* 21.) writeth, that *when there are Kedmata preſent* (by which *Galen* and others underſtand the fluxions into the Hip) *then the Veins behind the Ears are to be ſcarifyed.* But yet theſe think not that this precept of *Hippocrates* is true, or that it ought to be followed. But yet nevertheleſs *Scegghius* defendeth *Hippocrates*; and thinks that he did upon very good ground propound that which without doubt he had obſerved by experience. For ſeeing that the Cauſe of the evil diſtilleth into the Hip by the hole of the Nook, (or *Fernelius* his way) for the taking away the very Fountain and ſource of the Malady, he rightly determineth that the Remedy muſt be adminiſtred about the Ears. But if all this ſhould be granted, yet nevertheleſs thoſe *Kedmata* are not the *Iſchiadick pains* properly ſo called (which belong unto the Gout) but thoſe of which we made mention before.

The ſtronger kind of Purgations have here their place; and here the *Caryocoſtina Electuary* is of ſingular uſe, as alſo the *Arthritick Pills*, *Pill. Fœtidæ*, and the *Pills* of *Hermodactyls*. *Crato* indeed (in his 247. *Conſil.*) writeth that the *Iſchiadick or Sciatick* pains will not admit of, nor bear purges; in regard that the Humors have ſeated themſelves more in thoſe places: but this is to be underſtood of an inſufficient Purgation.

And here Vomitories ſeem to be more commodious then Purgers by the Belly, in regard that they evacuate the vitious Humors by a place more remote from the part affected.

But Repellers have here no place at al, becauſe that it may Juſtly be feared, leſt by the uſe of theſe the blood and other Humors may be driven back toward the part affected, and may be there heaped up.

Having firſt made uſe of General and Univerſal Remedies, we come then to the impoſing of Medicaments that attract and reſolve, and theſe ought to be of the ſtronger ſort, that they may call forth into the Superficies the Humor that is gotten into a deep place; which kind of Medicaments are provided of Herbs that diſcuſs, *viz. The Leaves of Eldern, Danewort or Wallwort, Lawrell, Rue, Betony, Camomil, Ground pine, Roſemary, Melilote, Muſtard Seed, and Staveſacre; as alſo the flies Cantharides, Pitch, Sulphur, Turpentine, Ammoniacum, Galbanum, Bdellium, Opopanax, and Euphorbium.*

Excellent likewiſe is that Medicament that is made of *Sciatica Creſſes* (of which we made mention above,) as alſo of *Water Creſſes*, and the Herb *Piperites*, or *Pepper-wort*, as ſome call it. As,

Take *Sciatica Creſſes, Dittander or Pepperwort, and Water Creſſes, of all, or one of them four handfuls: boyl them in Wine, and ſprinkle upon them the Meal of Lupines, Beans, and the bitter Vetch Orobus of each one ounce, the powder of dry Rue two drams,*

Flowers

Flowers of Camomile one dram, Coſtus Root a dram and half, Oyl of Turpentine half an ounce, Oyl of Earth-worms as much as will ſuffice, and make a Cataplaſm. Or,

Take *Muſtard ſeed diſſolved in the ſharpeſt Vinegar two ounces, ſharp and ſowr Leaven half an ounce, Powder of Hermodactyls two drams, Honey three ounces, Turpentine four ounces, Oyl of Lawrel and Spike, of each two ounces, the meal of Fenugreek ſeed one ounce and half; Earth of the Ant-hill with the Ants Eggs, one pound; Leaves of Lawrel, Sage, Rue, and Roſemary, of each half a handful; Earth-worms prepared half a pound: let the Ants Earth and Eggs, with the Earth-worms and Herbs, be boyled in white Wine, and then being ſtrained let the reſt of the Ingredients be mingled therewith.* Or,

Take *Roots of our Ladies ſeal (which being cut and applied to the Hip are much commended for the removing of the Iſchiadick pain) ſix drams, the Emplaſter* Diachylon ſimplex *half an ounce; Saffron diſſolved in the Spirit of Wine two drams, Turpentine one ounce, Oyl of Spike as much as is ſufficient; and make a Cataplaſm.* Or,

Take *Citrine Wax, and Turpentine of the Fir Tree, of each three ounces; let them diſſolve together: when they ſhal be cold ad the Powder of Nettle ſeed, and Hermodactyls, of each two drams; Roots of round Ariſtolochy or Birthwort, Camomile Flowers, and Florentine Flower-de-luce, of each two drams and half; Mirh two drams, Saffron four ſcruples: let them be moulded with the hands being firſt anoynted with Hogs Greaſe, and make an Emplaſter.* Or,

Take *Wax, Miſſletoe of the Oak, Turpentine, dry Orrace, Mirrh, and Galbanum and with the Oyl of Earth-worms make a Ceroſ.*

Unto which if the pain give not place, but ſtil continue, then apply Cupping-glaſſes with much flame, or elſe Veſicatories.

But if the Malady wil not yet by theſe be taken away, then we are according to the counſel of *Hippocrates* (in the ſixth Sect. of his Aphor. *Aphor.* 60.) to burn the part affected; and *Celſus* likewiſe approveth of this advice, whileſt (in his 4. B. and Chap. 12.) he writeth in this manner:

It is (ſaith he) *the laſt ſhift, and in old diſeaſes alſo a moſt efficacious Remedy, with glowing hot Irons to exulcerate the Skin in three or four places above the Hip.*

This Remedy by heating the part diſſolveth and evacuateth the thick and viſcid humors; and if the Ulcers be kept open (as they ought to be) the vitious matter floweth forth by them. As for the manner of burning, ſee more in *Paul. Ægineta* his ſixth Book, and Chap. 76. and *Albucaſ.* Part 1. Chap. 43.

And ſome there are likewiſe that make mention of the Gout of the Vertebræ of the Back, in ſpecial: and we grant indeed that now and then ſome ſuch kind of Gout there is; and this hath alſo the very ſame Cauſes and ſo requireth the ſame kind of Cure with the other Gouts. But we are here to look wel about us, and to have a care that we be not deceived, in miſtaking every pain of the Back for the Gout. For oftentimes it ſo happeneth that from the ſerous and wheyiſh matter flowing down from the Head, and deſcending along the Back, and eſpecially according to the Conveyance of the Cucullar Muſcle (and ſticking at the *Spina Dorſi*, in the end of the ſaid Muſcle) a pain may be excited; which yet nevertheleſs is not the Gout, in regard that it happeneth not in the parts pertaining to the Joynt; and it is oftentimes likewiſe of a very ſhort continuance, and afflicteth the ſick Perſons in their ſleep, but when they awake, and ariſe from their ſleep, it leaveth them and vaniſheth, which never happeneth in the true Gout.

Chap. 7 *Of the VVay and Means to prevent the Gout.*

The way to prevent the Gout.

MAny there are that mind only this one thing, to wit, that they may be freed from the preſent pains of the Gout; but being freed they take no care at all, how they may obtain that they be no more troubled with the ſame pains; neither do they make uſe of thoſe Medicaments by which they might prevent this Evil, nor at all refrain from the Errors of their Dyet; and ſo they ſuffer the Malady again to ariſe, and ſo to continue and grow old with them; and therefore it is no wonder, that there are ſo few perfectly recovered of the Gout. But a precaution, and prevention, is altogether as neceſſary as the Cure in ſpecial ſo called.

In what things it consisteth. Now this Consisteth in three things: The first is this, that there be care taken that there be no matter suffered to gather together which may flow unto the Joynts. The second, that if any matter be gotten together, it be taken away before it rush unto the Joynts. And the third is this, that the Joynts may not easily receive the same. Now if (as many do) any one shal make it his business only to strengthen the Joynts, and in the mean time shal permit the heaping up of the vitious matter in the Body; the Patient shal hence reap more hurt than good. For if there shal be a vitious Matter present in the Body, and this not thrust forth unto the Joynts, after the usual and accustomed manner, being retained in the Body it may flow unto other of the more noble parts, and be the Cause of most grievous Diseases.

And therefore we are here first of all to commend unto the Patient a good course of Dyet, and Medicaments that correct the distemper of the Bowels; the first intention being best performed by this. The second thing required is accomplished by Blood-letting, Purgings, and other things that take away the serous and Tartarous humors. The third, by those Medicaments that strengthen the Joynts.

The first member of prevention is the Dyet And first of all, As touching the Dyet, this is absolutely necessary, and may do much in the prevention of the Gout; and indeed it is of so great consequence, that without it the Medicaments (let them be never so excellent) wil nothing avail. And that so few are cured of the Gout, this for the most part happeneth by reason of the too great liberty and licence they take in point of Dyet. And on the contrary, a due course of Dyet hath been known it self alone oftentimes to vanquish this Malady: and *Crato* (in his 161. *Consil.*) writeth truly; *I think* (saith he) *that there is nothing more to be taken care of for those that are troubled with the Gout, than a right and due course of Dyet. For what Medicaments are there that can either draw forth the matter it self, or strengthen the Heat?*

And to likewise *Solenander* (*Sect.* 1. *Consil.* 20.) *We observe* (saith he) *that many by their care and diligence have made themselves free from the pains of the Gout; some by their being obstemious; others by their forbearance of Venereal embraces; a third sort, by reason of their continual using this or that proper Medicament: And others again, by their shunning of this or that kind of Meat, as hurtful in reference to this their Disease.*

Now the course of Dyet doth chiefly consist in the right use of the six things not Natural. And first of all, as touching the Air, let the excess of every Air in its qualities be shun'd; (for this may either retain, or disperse abroad the vitious humors in the Body) and especially the cold excess that retaineth and keepeth in the transpiration, and that notable exhaling of the vapors; yea and it forceth the wheyish humor from the outside of the Body unto the Centre, where it afterwards soon becometh over-hot (and boyling as it were) and then beginneth to be stird up and down. And therefore let all those that are troubled with the Gout very carefully fence themselves against the external injuries of the Air, by wearing of such warm Garments as are fit for them; and let them beware that the external Cold do not thicken the Habit of the Body, and so hinder the flowing forth of the vapors. And if it shal so happen that the habit of the Body shal be condensed, it is then again to be rarified by frequent but gentle frictions.

But more especially there is an exact and accurate regard to be had unto the Meat and Drink, and the constant Dyet of the Patient. For it being so that the Meat and Drink is wont to supply the matter of the Gout, unless the sick Person shal abstain from all food that is hurtful for his grief, or commit any errors in the use thereof, he shal but in vain hope for health and recovery. And therefore when the sick Persons shal themselves come to understand and take notice what meats are hurtful for them (as we told above of one who by the eating of Carps evermore fel into the Gout) then let them carefully and wholly abstain from them. And so also for the quantity of the food that is taken, it must be no more than what sufficeth for the refreshing of the Spirits, and the preservation of the strength of the Body. And he ought not upon any occasion to take in more food than what may rightly be concocted in the Stomack, Liver, and Spleen: which is then done if he take only that quantity of Meat and Drink that (according to the advice of *Hippocrates*) he alwaies rise from the Table with an Appetite, and that he never so fil himself with Meat and Drink, that he leave remaining no desire at all, nor any further appetite thereto. For since that in these Concoctions that which is excrementitious is wont to be separated, if those Concoctions shal not be rightly performed, many Excrements (and those Tartarous) are mingled with the Blood; which afterwards (as altogether useless) are by Nature, at her own time, thrust forth unto the Joynts. Or if it should so chance that the sick Person offend by taking too much food at one meal, he must be so much the more sparing in the meal following. And so likewise

The quantity of the Patients Food.

it

it will be to very good purpose, if once in the week he wholly forbear, or at least that he Eat a spare supper. And there ought likewise no new food to be taken until the former be Concocted. His supper must alwaies be more sparing then his dinner: and variety likewise of Meats at one and the same Meal is to be avoided, as being altogether as hurtful as the over great quantity and excess.

The quality of his Food.

And therefore let his bread be pure, and leavened; the flesh that he Eateth let it be Wether Mutton, Kids flesh, Veal, and the like, of a good Juyce and Aliment. There is likewise allowed young Beefe, especially in such as are hotter then ordinary: and *Alexander Trallianus* in his 11. *B. Chap.* 1. writeth, that he knew some who being troubled with an extream great and sharp fluxion, were chiefly holpen by the eating of Beef. Some there are that conceive there ought to be an abstaining from the flesh of Hens and Capons, and this therefore, because that it yieldeth much nourishment. But Meats of Good and much Juyce were never yet known to cast any one into the Gout, if there were not an Error committed in the Quantity. Others there are that think Cocks, Capons, and Hens, to be therefore hurtful for those that have the Gout, because that they themselves are now and then troubled with the same; which may indeed likewise happen for the Cause that we shall now shew you. For (in my Opinion) it seemeth most agreeable unto truth, that this cometh to pass, because that Cocks and Hens do likewise pick up and Eat Sand, and little Stones, and concoct them in their Maws; from which there may easily be derived into their very blood somthing that is Salt, Earthy, and Tartarous; and this may afterwards yield matter of the Gout unto him that eateth of their flesh. And this Opinion *Crato* (in his 246 *Consil.*) seemeth to favour, when he writes that the Capon hath a peculiar humor, which Nature driveth forth unto the Joynts. Let him Eat fish very sparingly; but from Carps, and moist fish (as Eeles and the like) let him altogether abstain: as also from those Meats that have in them a power to bind the Belly, or that cool the Stomach. And so likewise the use of much Cheese is not safe. He must abstain also from all kind of Pulse, that contain in them much Earthy Juyce. And because that (as *Crato* writeth in his 247. *Consil.*) between Wine and the Cabbage there is found to be a certain kind of Natural Antipathy, it is thought very fit, that such as are troubled with the Gout (as unto whom Wine is very hurtful) do often feed upon Cabbage and Barley Bread. And *Pliny* in his 20. *B.* and 9. *Chapter*, writeth thus: *I finde* (saith he) *that many have been freed from the Gout by eating the Cabbage, and drinking the broth thereof being boyled.* And many there are that upon very good ground condemn the use of apples; and advise the Physitians (led hereunto both by Reason and Observation) that they forbid the eating of Apples unto such of their Patients as they finde subject unto the Diseases of the Joynts. For Apples abound with moisture, and this for the most part partaking of some acrimony, and such as hath a power of penetrating (by reason of which it is that those spots that are caused by the Juyce of Apples can so hardly be gotten out of Linen) and therefore do very easily move the Humors. Let all fat Meats likewise be avoided, and especially fried Meats, as such as do not only afford an ill and vitious Nutriment, but also corrupt other Meats; as likewise Meats overmuch seasoned with hot Spices.

Hens, Cocks, and Capons hurtful in the gout.

But a more then ordinary Care must be had in the Choyce of the Patients drink. For it is altogether Requisite that he wholly abstain from the Moravian, Austrian, and Hungarian Wines, and such as are like unto these, which do most certainly breed the Gout. But as for others (which in such as are found do not so easily generate the Gout) they may be drunk, but it must be very sparingly, in regard that even these also contain in them some kind of Tartarous matter.

Among these Wines that are wholesome, *Solenander* in the 24. *Consil.* of his 4. *Sect.* reckoneth up likewise the Thick, Red, Spanish Wine, which they call Alicant, or the Wine they cal Tent: and of this Wine he alloweth a moderate use unto such as are troubled with the Gout, as being but little, or less hurtful for them. Others commend and allow of the *Pucine* Wine; as likewise that they bring unto us from the Vale of *Telina*; by reason that they have not in them so great a power of hurting the Joynts.

And if the Patient perceive that even these Wines also are naught and hurtful for his Disease, and that they offend him; let him then (if he can) altogether abstain from

from the drinking of any Wine; in regard that it may so be, that for such as are subject unto the Gout, even those Wines may hurt and offend them, which others drink without any hurt at all. And *Paulus Ægineta* (in his *Third Book of the matter of Physick, Chap.* 78.) writeth in this manner. *I have known many* (saith he) *who by their altogether abstaining only from wine, have all of them sensibly found help. For some in the very beginning of their Disease are perfectly freed from their fits, and others of them afterwards, and in these also the fits come but seldome; and when they come they are extreamly painful. If therefore there happen (from this abstinence) nothing prejudicial, either at present, or that nothing be feared for the future, let them abstain from Wine al their Life long. But as for those who by this their abstinence have brought a weakness and cold disposition upon themselves, and are thereby rendered unfit for their imployments, when they have for two years abstained from Wine, after this let them perpetually drink a little thereof at a time, and let it first be qualified with Water. But as for those that abstain from Wine, they ought instead of their Wine to drink the Decoction of Aniseeds, or some such like Seed, abstaining (as much as may be) from Fruits, Apples, and the rest of those Cooling Fruits.* Thus Ægineta.

And in very truth, that the Case thus stands, we have above, (in the *Second Chap.*) proved by examples. And in our own Countries, they that will may far more easily abstain from the drinking of Wine, then those in *Greece*, and elsewhere: in regard that good beer may every where conveniently enough be had, which may supply the place of Wine, and very wel serve in stead thereof. And although it seem very hard unto many (yea and hurtful also unto some) wholly to abstain from Wine, Yet Nevertheless (as it is rightly said by *Hippocrates*, in his 50. *Aphorism*) there is also somtimes a Change to be made unto that which we have not been accustomed unto. But if there be any that will not be perswaded wholly to abstain from Wine, (or if indeed they cannot, without great prejudice unto their health, as it very often happeneth) let them then drink Rhenish Wine, but not such as is strong, or Crude; or else the *Pucine* Wine also, or the like; and yet neither these in too great abundance, but with al possible sparingness. And therefore we like very well of *Solenanders* advice, who (in his 4. *Sect.* and 24. *Consil.*) perswadeth us, in the use of Wine, to have regard unto the Temperament, Constitution of the Body, Age, and Custom; since that there is great difference in Bodies; so that what is good and wholesom for one, the same may to another be altogether useless and hurtful. And therefore in the use of Wines, we are especially to observe what benefit or damage the sick person may receive from it. For if it be found that the drinking of Wine hurteth those that are thus affected, there must then be a total abstinence from it; or if it may not be wholly omitted, it must be most sparingly drunk. And as for those who in the use of Wine cannot moderate themselves, nor observe a mean and set bounds unto their Appetites, we think it fitter to forbid the use of Wine unto such persons, then to allow it them. But yet however al generally are wholly to abstain from Wine in the beginning of the Paroxysm. Neither must wine at any time be drunk upon an Empty Stomack, but then only when solid food is taken. It is likewise very hurtful to drink Wine betwixt Meals, in regard that it doth then easily penetrate unto the Liver and excite fluxions.

The quantity of his drink. Let the Patient content himself with so much drink only as may suffice for the satisfying of his Thirst, without causing any fluctuation of the food he hath Eaten.

Rest and sleep. As for his Sleep and Rest, let them be moderate; and let him not Sleep immediately after he hath Eaten and Drunk: and when he doth Sleep, let it not be above seven or eight hours at the most; yet seven hours Sleep he may well be allowed.

Exercise. Let the exercise of his Body be moderate, and let it alwaies be before dinner, or supper. And if the Aphorism of *Hippocrates* be true in any Disease, it is true in this: *viz. The exercise of health is this, not to be oversatiated with food, and to be active and industrious in paines taking,* and in the works of our calling. And very good it is for those that are able, before dinner somtimes to exercise themselves even until they sweat. But then after this motion and exercise of the Body, Let him neither Eat nor Drink, before such time as the heat contracted by the motion be wholly vanished. And if there be at any time an Error committed, in the excess either of rest or motion, better it is that it should be in motion, then in idleness

and

and Reſt. For by Idleneſs and ſlowth the heat is much diminiſhed, and the ſtrength of the Body made to languiſh, the Concoctions to be depraved, and the Excrements not evacuated and driven forth of the Body. Whereupon it is that *Galen* (in the *Sixth Sect. Epheriſm* 28.) tels us that eaſe and idleneſs is as much the Cauſe of the Gout, as Epicuriſm, and Satiety. And we may ſee by experience that Men addicted to labor and exerciſe are ſeldom or never taken with the Gout. And inſtead of the Morning exerciſe the Patient may likewiſe ſomtimes uſe frictions or Rubbings, ſo ſoon as he is up in the morning. To ſtand much, as alſo to walk overmuch, or to ride long Journeys, is greatly hurtful for ſuch as are troubled with the Gout.

And in the like manner as Exerciſe and Reſt, ſo alſo ought the Patients ſleep and abſtinence therefrom to be moderate, and alwaies in a mean. And yet of the two extreams, better it is to want ſleep, then to exceed therein; provided that the ſtrength of the Body be hereby nothing impaired, nor Crudities bred. Neither may the Patient accuſtom himſelf to ſleep preſently after meals.

Repletion, or fulneſs.

As for fulneſs and emptineſs, Care muſt be taken, that the Belly be made every day to diſcharge its office; and that the Humors may not be heaped up in the firſt waies, Eccoprotick or Cutting Medicaments are ſomtimes to be made uſe of; for theſe do gently eate and empty the Belly. Sweats in the morning are very uſeful and convenient for the prevention of the Gout, in regard that they take out of the Body the ſerous or wheyiſh Humors. And therefore the ſick perſons are by all manner of means to accuſtom themſelves unto theſe ſweats; and to this end, they ought wel to cover themſelves with Bed-clothes at night when they go to Bed; that ſo in the morning if they ſweat not, yet they may have a Moiſtneſs all over their Bodies.

Venery.

The Patient ought likewiſe to abſtain from exceſſive Venery, which together with *Bacchus* (or Wine) is the Parent of the Gout, as begetting and breeding it: for (as *Scaliger* turns it out of the Greek) of Loyn-looſening *Venus*, and Loyn-looſening *Bacchus*, there is born and bred the Loyn-looſening Gout. For by the overmuch uſe of Venery the whole Body is debilitated, and the ſpirits and Native heat diſſipated; whereupon all the Concoctions are hurt, and many Excrements are treaſured up.

Affects of the mind.

The immoderate affections of the mind, (and eſpecially Anger and Fear) are to be ſhunned; and the Patient is rather to give himſelf unto Mirth and Cheerfulneſs.

Why the Rich are more troubled with the Gout then the poor.

And that kind of Diet which is obſerved by Rich perſons, and people of rank and quality, is the true Cauſe why theſe are more frequently taken with the Gout, then poor people, and ſuch as live in the Country. For the Rich aboundeth with ſtore of al kind of Meat, and dainty diſhes; and thereupon they uſually eat of many diſhes at one and the ſame meal; and not only ſo, but they alſo exceed in the quantity, and take too much thereof, even more then they can Concoct; and hereupon Crudities are generated; and eſpecially they too much indulge themſelves in the uſe of Wine. And then again they want thoſe Laborious exerciſes by which the excrementitious Humors in the Body (and chiefly, the ſerous) might be evacuated. And moreover, for the moſt part they abhor all manner of Medicaments; and they wil not at all make uſe of them, unleſs they be fitted for their Palates.

And ſo in general, thoſe things that are by the Phyſitians (in other Caſes) commanded as touching a good and orderly Diet, they are here eſpecially to be obſerved by ſuch as are troubled with the Gout; concerning which *Alexander Trallianus* largely treateth, in his *Eleventh B.* and 1. *Chap.* and ſo alſo *Andræas Gallus*, in his *Conſil. Collected* by *Scholtzius*, *Conſil.* 270. And *Petrus Andræas Matthiolus*, *ibid. Conſil.* 220. and *Antonius Ferrus*, in his *Tract of the Gout.*

The diſtemper of the bowels to be corrected.

And yet notwithſtanding beſides a good courſe of Dyet, it is likewiſe neceſſary (leſt that the vitious Humors ſhould be heaped up) that there be no notable diſtemper ſuffered to be in the Bowels. And therefore if there be any diſtemper of the Liver, or Spleen, or that the Stomack being colder then ordinary cannot rightly Concoct, thoſe diſtempers are in a fit and convenient manner to be Corrected, as we have further ſhewn you in its proper place.

For

For unleſs thoſe Bowels be wel conſtituted (although there be little or no Error committed in point of Dyet) yet notwithſtanding, good food (albeit it be taken in a juſt quantity) is converted into a vitious humor, or ſupplieth ſuch a Blood that is not pure, but hath likewiſe vitious humors mingled therewithall. Whereas on the contrary, Thoſe that have their Bowels wel conſtituted and ſtrong (which exactly ſeparate from the uſeful Blood that which is faulty in the Meat and Drink, and evacuate it forth by convenient waies) may overcome many Errors of Dyet; as we ſee many greedy gluttonous Perſons ſtuffing themſelves with abundance of food, and guzzling in dayly great ſtore of Wine (and this not alwaies ſo wholſom as it ſhould be) and yet notwithſtanding all this they are not at all troubled, no nor ſo much as ſubject to the Gout.

But becauſe that it is altogether impoſſible but that he which lives not unto himſelf alone, but hath his dependance for the moſt part upon others, and is a Servant unto the publique, or is ſet over and imployed in other kind of affairs, and is ſomtimes neceſſitated to live in an unhealthy Air, or to ride Journeys, or to ſojourn with others; it being impoſſible (I ſay) that they can keep themſelves from all kind of Errors in point of Dyet, and that thereupon Excrements ſhould be collected in the Body; it ought therefore to be one main part of the Phyſitians care that he prevent (in this reſpect) the heaping up of thoſe Excrements in the Body, leſt that they afterwards excite the Paroxyſm; which is done if they be maturely taken out of the Body.

Veneſection.

Veneſection. And therefore in the firſt place, although the Gout doth not immediately ariſe from the Blood, as ſuch; yet notwithſtanding in regard that it may in its own manner concur unto the generating of the Gout, whiles it either maketh for and furthereth the extream and boyling heat of the wheyiſh humor, if it aboundeth; or elſe may be an impediment in the exhibition and adminiſtring of thoſe Medicaments that are neceſſary; the Blood may therefore be evacuated. But as for ſuch as have Naturally a very weak and cold Body, ſuch as theſe receive more hurt than help from this evacuation of the Blood, as *Paulus Ægineta* tels us in his 3. B. Chap. 78. and ſo likewiſe for thoſe that have already of a long time been troubled with a frequent fluxion; for by thoſe often afflicting pains, and reſtleſſneſs, the Spirits are diſſipated, and the ſtrength of the Body much dejected. But now this Evacuation of the Blood is moſt convenient in the Spring and Autumn. But yet in ſome it is requiſite that this taking of Blood from them be not done only at once, but by often repetitions, ſome now, ſome then. For if the ſick Perſon be one that uſeth a ful and free Dyet (eating and drinking liberally) upon the very firſt alteration of the Air there is wont to happen a motion and boyling heat of the humors. But becauſe that in the preſervation we are not wont to have any reſpect unto the part affected it ſelf, but only our mind and purpoſe is to evacuate the Blood when it aboundeth, it is moſt fitly taken forth (not only in the *Podagra* or Gout in the Foot) but generally in all Gouts whatſoever, by opening a Vein in the Arm. But if the Malady be in the Arm alone (as it is in the *Chiragra* or Gout of the Hands) then the Vein in the Thigh is moſt conveniently opened.

There are ſome who for ſuch as are troubled with the Gout in their Feet do prefcribe the opening of the Veins in their great Toes, and that every month, and then not all at once, but by repeating it a ſecond or third time: and I my ſelf have known thoſe that have received great benefit hereby. And this practice of theirs is grounded upon Reaſon. For Nature is wont chiefly and principally to thruſt forth the vitious humors unto the extream parts of the Body, and to the Veins, and eſpecially thoſe unto which ſhe is accuſtomed to excite a fluxion. And therefore ſeeing it is probable, that in thoſe who are troubled with the Gout Nature doth ſend the Tartarous humors in greater abundance unto the Veins in the great Toes, than unto any other parts; therefore they are moſt conveniently evacuated by opening a Vein there. Neither can the ſtrength and vigor of the Body be very much impayred by this evacuation, ſo that it be not in the extream. And that which *Coſtæus* (in his 3. B. upon *Avicen. Sen.* 22. *Tratt.* 2. Chap. 2.) writeth, that he ſaw one who having had a burning made in his Thigh by the Phyſitian, there flowed forth very frequently great ſtore of a humor altogether Black (upon the evacuation of which the Affect was wholly removed) ſeemeth very much to favor this Opinion. And others for the ſame end and purpoſe every month apply Cupping-glaſſes unto the Soles of the Feet; and this muſt be before the new Moon, and without any Scarification at all. And I know a certain Perſon of quality, who by the alone uſe of theſe preventeth the Gout.

But

But as touching the evacuation it ſelf of the ſerous and Tartarous humor, let this be by the Belly, by the ſuperficies of the Body, ſenſibly, and inſenſibly; by the Urine, and by Iſſues. *The Evacuation of the ſerous and tartarous humor.*

Purgation.

Purgation (which indeed bringeth with it the greateſt benefit of any other) is to be begun with Medicaments that evacuate the ſerous humor by the Belly. And it hath been found by experience, that ſome certain Perſons who have been troubled with this Grief have found greater benefit by often repeated Purgations, than they have by any other Medicament whatſoever; and that Purges have oftentimes benefited much with out any other Medicament whereas all other Medicaments without Purgation are altogether unavailable, or at leaſt afford but ſmal benefit. Neither is there any danger at all to be feared from theſe Purgations, eſpecially if thoſe Purging Medicaments be not overſtrong. Wherefore not without cauſe is it that *Solenander* (in his 4 *Sect.* and 24. *Conſil.*) ſo confidently affirmeth, that there is more of the Spirits reſolved by Pains, the Strength more impaired, the Limbs more weakned, and laſtly, the faculties of the whol Body more altered by the influx of the humors into the Joynts in one Paroxyſm only, than by ſeven of theſe moderate purging Medicaments; as it hath been found by the experience of thoſe that have made uſe of them. *Purgation.*

And indeed this evacuation is moſt conveniently made in the Spring time, and the Autumn, a little before the Equinoctial; at which time the humors are wont to be moved of their own accord. Yea and if any wil uſe that diligence that is requiſite in the prevention of the Gout, he muſt Purge his Body three or four times in the yeer. Which Purgation (together with Veneſection, and a right courſe of Dyet) maketh very much for the preventing the Gout; touching which *Galen* in his 7. Chap. of the way of Curing by Veneſection. *I my ſelf have Cured very many* (ſaith he) *who for three or four yeers* (*by Intervals, and at ſome certain ſeaſons*) *had been troubled with pains of their Feet, by purging forth in the beginning of the Spring the abounding humor, and by diminiſhing of the Blood. But this ought to be known and wel underſtood by all, that they are to be very moderate throughout the whol courſe of their Dyet. For as for ſuch as are intemperate, given to Drinking of Wine exceſſively, and ſuch likewiſe as are addicted to their Bellies, and indulge their Appetites, there is but little good or help to be expected by them, either from Purgation, or Blood-letting. For by the intemperancy of their lives they get together, and heap up great ſtore of vitious humors. Now as for theſe we are not ſo much as to afford them any the leaſt helping hand, or aſſiſtance*; thus *Galen*. *When the Purgation muſt be adminiſtred.*

Now it is wel worth our Conſideration, by what Medicaments thoſe Purgations are to be inſtituted, and carried on. There are ſome indeed who here commend their *Aurelii* Powders, and their Mercurial Medicaments, which do both provoke to vomiting, as alſo Purge by the Belly. But for my own part I ſhal not perſwade any to make uſe of theſe for his preſervation from the Gout: Let him do it at his own peril who ever hath a mind to it. But much leſs ſhal I perſwade any one (as I find that many have given counſel thus to do) that he four times in a month (alwaies after the Changes of the Moon) take *Mercurius Vitæ*, thereby to cauſe both Vomitings and Stools. For ſince that thoſe Mercurial Medicaments cauſe extraordinary agitations and ſtirrings of the humors, and do withall weaken the Bowels, they more hurt than benefit thoſe that make uſe of them: neither let any one perſwade himſelf, that the ſaid Cure of preſervation can poſſibly be accompliſhed in one month. *By what kind of Medicaments.*

There are others again who conceive that only thoſe moſt gentle and eaſie Medicaments are to be uſed: but theſe are ſcarcely at all times able to draw forth the peccant humor. The truth is, as it is moſt ſafe, ſo it is likewiſe moſt beneficial, to make uſe of thoſe Medicaments that indeed hurt neither the Stomack nor the other Bowels; and yet notwithſtanding they evacuate the peccant humor as much as is needful. From which neither *Scammony*, nor *Turbith*, nor *Hermodactyls* are altogether to be excluded: but *Sene*, *Agarick*, and *Rheubarb* have a chief place among them.

But beſides theſe ordinary and yeerly evacuations, there are likewiſe every month (yea, and oftener if need require) certain gentle Medicaments to be made uſe of; which ſenſibly derive the matter unto the Bowels, and keep the belly looſe. Yea, and if every week twice, one hour before ſupper, the ſick perſon take either a ſcruple of ſome gentle Pills, or ſome other ſuch like Medicaments, he ſhal ſoon find no ſmal benefit thereby. And ſuch are the *Syrup of Roſes ſolutive, and Honey of Roſes ſolutive, Syrup of the Harts*

marrow

marrow (commonly called the Domestick or House Syrup) *the seed of Carthamus or wild Saffron, Danewort* (or *Dwarf-Elder*) *Aloes, Agarick, Rheubarb*; especially where the *Colerick Ichores* abound. Yet nevertheless, seeing that these alone (as we have already said) are not sufficient, unless the party take likewise every yeer twice or thrice those Medicaments that are somwhat stronger, in the spring therefore, and at Autumn there is to be administred a Purgation that is somwhat stronger than ordinary.

But now here to set down the many forms of those Medicaments, I hold it not worth the while; in regard that such as are most proper for every ones Constitution are best of al prescribed by the Physitian who is present, and may therefore most rightly discover the Patients Constitution. And although that Serous and Tartarous humor be the nigheſt cause of this Malady; yet notwithstanding somtimes these, and somtimes those vitious humors do mingle and joyn themselves with the humor aforesaid, and they are therefore withal to be evacuated. And there are but very few purging Medicaments that do not withal likewise evacuate the said wheyish humor.

The Caryocostine Electuary of Bayrus.

They here greatly extol the *Caryocostine Electuary*, invented and commended by *Petrus Bayrus* in the 18. *B.* and 1. *Chapt.* of his *Practice*; although without doubt the Ancients (*Aetius*, and *Paulus Ægineta*) gave the first occasion for the Composition of this Electuary; and in them there are many things to the like purpose. Now the aforesaid Electuary is made in this manner:

Take *white Hermodactyls* (their upper rind being taken off) *and Diagrydium, of each two drams: Costus, Cummin, Cloves, Ginger, of each one dram, and make a Pouder.*

Of which the Dose is one dram, more or less. Or else being beaten very smal and seared, let them be mingled with the Syrup that is made of Honey and white Wine (boyled until they have attained the form of a Syrup wel boyled) and then make an Electuary: The Dose hereof is from two drams to half an ounce. And *Bayrus* writeth, that so soon as ever he perceived in himself signs of Repletion, he took this Electuary three or four times in the yeer; and by this means he kept himself (for twenty six yeers) altogether unmolested by those pains with which he had been formerly assaulted. And indeed it wil not be amiss then to make use of some Medicament that is proper, when we find there is so much of the humors already collected, that the Paroxysm seemeth to be very nigh at hand. And here we are likewise to commend unto you *Rhases* his Pills, described before in the Cure: and so likewise these:

Take *Groundpine or Herb Ivy, half an ounce; Germander, Arabian Lavender, of each three drams; Hermodactyls half an ounce; St. Johns wort one dram: Aloes Hepatick half an ounce: with Turpentine of Cyprus make Pills.*

Whether or no Hermodactyls be convenient in preservation from the gout?

But now as for those Medicaments that are made use of more frequently (every, or every other week, or three weeks, or a month together) these ought to be more mild and moderate. And here *Adrian Spigelius* writeth, that he in the preservation of himself from the Gout never made use of Hermodactyls in any Purgation; since that it is not requisite that we draw forth the Humors out of those parts into the which as yet nothing hath flown; but he adviseth us to content our selves with those things that evacuate the humors out of the greater veins; unless haply it be in the old knotty Gout (which hath more frequent invasions) or that (as we said before) the Paroxysm be now nigh at hand. Which as we grant it to be true in those Purgations that are more frequently (and in shorter intervals) administred: so in those Purgations that are to be twice or thrice every yeer, we conceive that Hermodactyls may most fitly be mingled therewithal; and these al the more experienced Physitians, even unto our daies, have made use of; as without doubt having al of them learned by experience, that Hermodactyls had in them a peculiar power of evacuating those humors breeding the Gout. And the Author of the little B. touching the *Podagra* or the Gout in the Feet, (whose name we find not, and yet we find his Book among the Writings of the principal Physitians) writeth, that he himself knew by experience, That in the Gout (whatever the peccant humor were) that Purgation that was made with Hermodactyls in it was more useful and effectual in this case than any other. And hence it is also that *Rhases* his Pills, and the Caryocostine Electuary of *Bayrus* have Hermodactyls in their Composition. But now that those Medicaments may be taken without any nauseousness or loathing in the Stomach, their forms are to be changed; and they may be taken somtimes in the form of a Pouder, somtimes of Pills, somtimes of Electuaries, and somtimes in the form of little Rolls, or Morsels, as they cal them.

A Vomit. A Vomit also is here very good, and bringeth much benefit along with it, if Nature be able easily

eaſily to bear the ſame; in regard that it doth beſt of al exclude and evacuate Color and Flegm ſticking in the firſt waies or paſſages.

Antipodagrick Medicaments; Or, *Medicaments againſt the Gout.*

The Body being purged, after this Antipodagrick Antidotes are to be made uſe of, that ſo the remainders of the Humors that eſcaped the purgations may by thoſe be quite conſumed; and that the body may (by once taking of them) be diſpoſed unto the morning ſweats; or that the ſerous humors may inſenſibly be diſcuſſed, as we ſhal anon ſhew you, when we come to ſpeak further of the power and virtue of theſe Medicaments. Thoſe kind of Medicaments were with the Ancients of very great uſe; and by them they are greatly commended: and there are very many of them extant in *Aetius* his *Tetrab.* 3. *Serm.* 4. *Chap.* 47. *Alexander Trallianus* in his 11. *B. Chap.* 62. And amongſt the latter Phyſitians alſo ſuch like Medicaments are every where to be found. *Medicaments againſt the Gout*

And among thoſe Medicaments, in the firſt place we meet with Treacle; touching which the Author of the Book of Treacle, to *Piſo*, in his 15. Chapter, writeth: *But it moſt of all profiteth* (ſaith he) *when any one ſhall frequently take thereof whiles he is yet well and in health; in regard that it conſumeth the ſuperfluous humors of the whol body, and changeth likewiſe the temperament thereof.* And a little after: *I adviſe* (ſaith he) *that every man in ſuch like diſeaſes would uſe* Treacle; *becauſe that it both drieth up the ſuperfluous humors, and permitteth not that any other be bred; whereupon very many from the uſe of this alone in the beginning have been altogether freed from the Gout.* *Treacle*

Aetius in the place alleadged hath this deſcription of the Antidote conſiſting of four things, by ſome called a *Myſtery*, viz. *The Antidote of four things*

Take *Gentian, Bayberries, Mirrh, equal parts, and make a pouder.* Give hereof every day half a ſpoonful in hot Water.

Oribaſius in the place alleadged hath another deſcription hereof.

Take *Germander one pound; Gentian, round Ariſtolochy or Birthwort, of each two ounces; Rue ſeed one ſextary: Let them be well bruiſed and ſearſed.* Give dayly hereof one ſpoonful.

That which is made of ſeven things, hath as followeth:

Take *St. Johns wort one ounce; Centaury, and Groundpine, of each three ounces; Gentian five ounces; round Ariſtolochy one ounce; Agarick three ounces; Parſley one ounce; Attick Honey five pound.* The Doſe one dram in three Cyaths of Water. *The Antidote of ſeven things.*

But *Aetius* chiefly commendeth the Antidote of Centaury; and he writeth that he knew many cured by the uſe thereof; and that it was ſo wholſom for ſuch as were troubled with the Gout, that the uſe thereof had enabled many that had been affected herewith fifteen yeers, and ſo wel recovered them that they went journeys on foot; and that it was grateful to the ſtomach, convenient for the belly, and provoking much urine. The manner of making it is thus: *The Antidote of Centaury.*

Take *the tops of Centaury the leſs, Roots of Centaury the greater, Germander, Gentian, round Ariſtolochy, of each alike, as ſuppoſe one pound.* Let one dram hereof be given (for fourty daies) out of hot water; and in the other three hundred twenty five following daies of the yeer, let half a dram be adminiſtred after the ſame manner.

And the ſame *Aetius* likewiſe very highly commendeth the Antidote of *St. Johns wort*, as that which cureth al manner of Gouts, the Diſeaſe of the Hips, and al diſeaſes of the joynts in general, being drunk for the ſpace of one whol yeer; that it warmeth and cheriſheth the ſtomach, maketh the ſight ſharp and quick; and that it maketh the reſt of the ſenſes alſo more cleer, and fitter for the diſcharge of their ſeveral Offices; that it gently evacuateth the Urine; and that it is excellent good in the falling-ſickneſs, that it freeth from the great and grievous pains of the head; and laſtly, that it mollifieth the Liver and the Spleen when they are hardened into a *Schirrus*. *The Antidote of St. Johns wort*

Now the manner of making it is this:

Take *Germander nine ounces; Centaury eight ounces; round Ariſtolochy ſeven ounces; Gentian Root ſix ounces: the tops of St. Johns wort five ounces; Parſley four ounces; Spignel three ounces; Valerian two ounces; Agarick two ounces; Honey well ſcummed three pound.*

Alexander Trallianus greatly commendeth this Antidote of the Philoſopher *Heraclitus* as much approved of by many. *Viz.* *Heraclitus his Antidote*

Take *Spicknard two ounces; Gentian, long Ariſtolochy, round Ariſtolochy or Birth-*

wort, the beſt Myrrh, Bayberries, Rhapontick, of each half an ounce. The Doſe is one dram. The beſt time to take it is the beginning of the Spring, and the Autumn; and indeed in thoſe places and perſons that are cold, the Spring time; but in others that are more hot, the Autumn.

The Antidote Diacorallium: The ſame *Trallianus* preferreth the *Diacorallium* Antidote before al other Antidotes whatſoever; which is thus made:

Take *of Corals two drams; Mirrh four ounces; Cloves half an ounce; Rhapontick one ounce; Peony Root the like quantity; long and round Ariſtolochy, of each two ounces; Spicknard four ounces; and make hereof a Pouder.*

And of this he giveth in the morning one ſcruple, out of warm water; and after it he enjoyneth abſtinence from al kind of food for ſix hours (but yet the truth is, a ſhorter time of faſting may ſuffice) & maketh the beginning hereof about the Kalends of *January*, and ſo continueth adminiſtring of it for a hundred daies (by reaſon of the long continued perſeverance of the Indication, as *Cappivaccius* explaineth it:) and then for thirty daies he intermitteth the adminiſtring of it (becauſe of the ſtrength and powers of the body, that they may be recollected, as the ſame *Cappivaccius* tels us.) And then again he adminiſtreth it for a hundred daies more; and ſo again, as before, he intermits for thirty daies. When the two hundred and ſixty daies (wherein there were two hundred potions adminiſtred) are over and paſt, he then giveth it again, but now not every day, but only every other day; and ſo in a hundred and three ſcore daies he adminiſtreth fourſcore Potions. And afterwards again in two hundred and ſixty daies he adminiſtreth eighty Potions, giving them every third day until the three hundred ſixty five Potions ſhal have been al taken. But he warneth them that take this Antidote, that they abſtain from Anger, Venery, Aſtringent and ſweet Wine, al kind of bitter Pot-herbs, the heads of Fiſh, Crabs, and Creviſhes, Lobſters, Eels, Hares fleſh, al kind of Pulſe, but more eſpecially Beans. And many more of ſuch like Antidotes there are to be found in *Paulus Ægineta, Aetius*, and *Trallianus*, in the places before alleadged.

Out of theſe afterwards (in the Ages not long before ours, and in our Age alſo) there aroſe divers other ſuch like Compoſitions. *Thomas Eraſtus* telleth us that he had two of theſe communicated unto him, and extolled with high commendations: One of them that was given him by an Italian Phyſitian (who called it the Pouder of *Jupiter*) and was imparted unto him by Doctor *Conradus Geſner*, is made in this manner following:

Jupiters Pouder Take *Round Ariſtolochy, ſuch as is right, the true Rhapontick, of each one ounce; Macedonian Parſley ſeed half an ounce; Germander tops, Centaury the leſs, and St. Johns wort, of each ten drams: make a Pouder hereof.*

In the firſt month give every day one dram hereof, out of warm Water; and afterwards half a dram, for one whol yeer; every month you muſt alſo order the Patient to take a purge or two; or elſe (for ſuch as are flegmatick) you may intermingle the Pouder of Agarick with the aforeſaid Pouder, a little to purge the ſick perſon.

The other Compoſition beſtowed on me by Dn. D. *Chriſtoph. Wirſung*, an Auguſtan Phyſitian, is thus to be made:

Take *the true round Ariſtolochy, Gentian, Rhapontick, or Centaury the greater* (but I think the true Rhapontick to be better) *the tops of Germander, Groundpine or Herb Ivy, of each alike, and make a Pouder.* Let there be one dram hereof taken for the one half of the yeer; and for the other half of the yeer half a dram.

Doctor *Johannes Mattheus* (out of an old Manuſcript) produceth this Pouder, as he there findeth it preſcribed, *Viz.*

Take *Rhapontick one ounce; Agarick two ounces; Valerian three ounces; Macedonian Parſley ſeed, and Spignel, of each four ounces; Gentian, and Ariſtolochy, of each ſeven ounces; Germander nine ounces, and make a Pouder.*

Donzellinus his Pouder is as followeth:

Take *Germander, Groundpine, both the Centauries* (or only the leſſer) *Marjoram, Sage, Betony, Gentian, and Birthwort, of each one ounce: the beſt Guajacum eight ounces or one pound: and make a Pouder.*

And by this one Remedy alone *Donzellinus* writeth that the Gout may be perfectly cured, provided that a man live not like unto a *Sardanapalus.*

Crato his Pouder is this.

Take *Ariſtolochy one ounce, Centaury the leſs three drams; Gentian ſix drams; Spignel, five drams; St. Johns Wort, ſix drams, Parſley of* Macedonia *half an ounce, Agarick two drams, Rhapontick, or (if that may not be had) Rheubarb one dram; and make a Pouder.*

a Pouder. Of which he giveth in the morning two ſcruples in the Water of Groundpine, or Betony Water (with the Syrup of either of the two former) in *January* five daies, in *February* as many, in *March* two, in *May* three, in *June* one, in *July* two, in *Auguſt* one, in *September*, *October*, *November*, and *December*, two: but it matters not much if it be oftener taken; only as he ſaith it wil be ſomwhat better to take it in the manner aforeſaid.

This following is Doctor *Manard* his Pouder.

Take *Germander*, *Dittany of Crete*, *Groundpine or Herb Ivy*, *Roots of the greater Centaury*, *and round Ariſtolochy*, *of each two ounces*: *the inward Rinds of Walnuts one pound*: *make a Pouder.* The Doſe is one dram for forty daies.

This Pouder next following is attributed unto *Eraſtus.*

Take *Harts-horn burnt*, *Beef bones burnt*, *the Kernels of the Citron*, *Dates*, *Jaws of the Luce-fiſh or Pike*, *equal parts*: *burnt Coral*, *and burnt Ivory*, *of each half parts*: *make hereof a Pouder.* Unto which (for the taſts ſake) you may add a little Cinnamon, Mace, and Cloves; and with Sugar make a Pouder.

Johannes Anglicus greatly commendeth this Pouder, which he calleth the *Sarracenick* Pouder: *The Sarracenick Pouder.*

Take *Herb Ivy or Groundpine one ounce*: *the bones of man or woman burnt two drams*: *Liquoris three drams*: *make a Pouder.*

And yet nevertheleſs the ſick perſon is not ſtrictly and preciſely to be tyed unto any forms of Pouders; but of the ſame ſimple Medicaments there may with Sugar or ſome convenient Syrup be made Electuaries or Pills (which for the moſt part are very fitly made up with Turpentine of Cyprus, ſince that moſt of thoſe that are troubled with the Gout are likewiſe obnoxious and ſubject unto the Stone) or Extracts, or thoſe Medicaments they cal Eſſences, or liquid Extracts, or a Wine, or a Medicate Drink; that ſo in this manner alſo the palat of the ſick perſon may be pleaſed.

Antonius Gallus (a Phyſitian ſomtimes of *Paris*) greatly commendeth this Electuary:

Take *Valerian one dram*: *Agarick two drams*: *Spignel three drams*: *Macedonian Parſley ſeed four drams*: *St. Johns wort five drams*: *Gentian ſix drams*: *Birthwort ſeven drams*: *the leſſer Centaury eight drams*: *Groundpine nine drams*: *Mans bones taken out of the Joynts*, *and moderately dried ten drams*: *with Oxymel Scillitick as much as will ſuffice make an Electuary*: *the Doſe whereof is one dram for a whol yeer together.* Or,

Take *the Conſerve of Germander three ounces*: *of Herb Ivy*, *and Betony Leaves*, *of each one ounce and half*: *Seeds of St. Johns wort*, *Roots of round Ariſtolochy*, *of each half an ounce*; *Angelica two drams*: *the bones of a Man prepared*, *red Corals prepared*, *Ivory prepared*, *of each one dram*: *Cloves and Cinnamon*, *of each two drams*: *and with the Syrup of Betony make an Electuary.*

And we may likewiſe add the Medicaments of latter Phyſitians, viz. their Magiſteria, their Feculæ, and their Salts; as alſo Margarites, and Crabs Eyes. As,

Take *Roots of Spignel or Maſterwort*, *St. Johns wort*, *of each one ounce*: *the Feculæ of Cuckowpint two drams*: *the Salt of Groundpine*, *of Germander*, *of Cherfoyl*, *and of Maſterwort*, *of each one ſcruple*: *Magiſtery of Corals*, *and Crabs Eyes*, *of each half a dram*: *Margarites one ſcruple*: *Sugar as much in weight as all of them*: *and make a Pouder.*

For the cauſing and provoking morning ſweats there are alſo given Syrups of the Berries of Eldern prepared with Sugar two ſpoonfuls; and if you pleaſe there may likewiſe a little Harts-horn be added.

Crato commendeth this Diſtillation, of which one ſpoonful is to be taken every day in the week once, if not oftener.

Take *Balm*, *Valerian*, *Juniper Berries*, *of each what you think fit*; *Let them be ſprinkled with good ſweet Wine*; *then macerated in Balm Water*, *and afterwards deſtilled.*

And in cold Bodies there may alſo very conveniently be uſed that *Aquæ vitæ* which *Gilbertus Horſtius Hollandus*, once a famous Phyſitian at *Rome*, made frequent uſe of; and it is thus prepared.

Take *Roſemary flowers*, *the leſſer Centaury*, *Camomile flowers*, *Groundpine*, *St. Johns wort*, *Germander*, *Aſarabacca*, *of each one ounce*; *the Rinde of Dwarf-Elder Root one handful*, *Orace one ounce*; *Treacle half an ounce*, *Cinnamom*, *Nutmeg*, *Ga-* Gilbertus Hoſtius his Aqua vitæ

lingal,

lingal, Mace, and Ginger, of each one dram and half; Hermodactyls, and Aloes Hepatick, of each one dram; Agarick half an ounce; Coloquintida three drams; all the Myrobalans, of each two drams, Roots of Polypody of the Oak one ounce and half; Leaves of Choyce Sene, one ounce; Seeds of Anise, Dauk, and Fenel, of each one dram; infuse them in the spirit of Wine, (that so the said spirit may lie a fingers breadth above them) for two daies space; and then let them be afterwards destilled in *Balneo Mariæ.* Of this Water he gave unto such as had the Gout, from one ounce to three ounces, in the morning.

The Decoction of Ground pine:

But now in the Judgment of very many the Decoction of *Groundpine* may serve in stead of all the aforesaid Medicaments, and will do better than any one of them; and therefore it was likewise highly commended unto the Emperor *Charls* the fifth by the Physitians of *Genoa*: and *Solenander* in his *fifth Sect. Consil.* 1. tels us, that it hath been found by experience, that very many which had drunk of this Decoction for the space of threescore daies, have been wholly freed from the Gout, and restored unto their healths; whereas before they had both the Joynts of their hands, and of their feet also grievously afflicted and tortured by this Disease. And no wonder, for it attenuateth the thick Humors, and consumeth them; driveth forth the Excrements by Urine, or else by sweat evidently; or else it insensibly discusseth them by transpiration: and it strengtheneth also all the internal bowels, and every kind of Nerve, yea and the whole habit of the Body. But because that *Vesalius* writeth so largely and fully touching this *Decoction* of *Groundpine*, and the advice given by the Physitians of *Genoa* (as we may see in his *Epistle to Joachimus Rœlandus, touching the China Root, about the end thereof*) We think it not amiss, neither our time ill spent, to give you his words at large, as we find them in the said Epistle. *No man* (saith he) *can blame me for administring at a fit and convenient time that Medicament which I find commended by the prime* Genoa *Physitians, as divine, and as if it were some Deity; and which (with the greatest promises that might be of the perpetual banishment of the Articular Disease) was some months since sent unto Doctor* Marsillus Colla, *(Master of the Horse to the Emperour, and one that for his many extraordinary parts, and endowments of mind, is worthy of more health then what at present he enjoyeth;) and now again also so brought unto* Cæsar, *that for the future we may most certainly conclude, and promise him, that he shal never more hence forward be troubled with the pain in his Joynts, if he please but to make use of this Medicament. Now in very truth the whole description hereof is sufficiently Empirical, and containeth in it nothing else but that at the first, and in the very beginning of the Malady, a purgation is to be administred; and then afterwards, the Leaves of Groundpine (some call it Herb Ivy, or the little and low Oak) be cut in pieces whilest they be yet green, if they may then be had, (but I for my own part would rather have it dry; and as in all other Herbs that have in them a faculty of drying, I prefer it before that which is green and newly gathered) and then boiled in white wine; and of this Decoction one Cup given in the morning, three hours before dinner: although in the mean time however it be added, that the longer before dinner the Decoction aforesaid be taken and drunk, so much the more benefit is to be expected from it. In reference to the course of Dyet, whosoever maketh use hereof must abstain from all meats that are sharp, sour, and Salt; and the drinking of that Wine is prescribed for sixty daies, with this addition, that the distilled Liquor, or Water of the aforesaid Herb, will add and confer much unto the strength of the said wine, (which seemeth unto me very ridiculous:) and that therefore for such as are not pleased with the Decoction, they are to have the Water given them. As for any thing else, we find nothing in the whole sheet sent hither unto us, besides a great and swelling Title, and a large Catalogue underneath of those persons who by the use thereof lived free from the Disease of the Joynts, for some years, and of such as made use thereof when it was sent unto them; in which Catalogue we find* Cardinal Dorias *to be the first, and foremost.* Thus far *Vesalius.* From whose words it evidently appeareth, that he himself gave not his ful consent unto the praise and commendation of this Decoction. And very credible it is, that it did not benefit al that drank it: and yet notwithstanding if we shall well weigh the virtues thereof (as they are before propounded) it wil from thence manifestly appear, that it is indeed a very excellent and precious Remedy in the Gout. But this *Vesalius* rightly tels us, and gives us notice of it, that the distilled Water cannot (in probability) add any thing unto the Decoction, in regard that the distilled Waters (as many falsly think) have not all

the

the faculties and virtues of the simple; for all the parts thereof are not elevated into the Alembick.

But now this Herb *Ground-pine* may be drawn into use many several waies. Some take a pottle of *Rhenish Wine*, the *purest Water* one pint, *Honey* of *Roses*, the fourth or sixth part of a quart. Boyl all upon the Coals in an Earthen Vessel, and scum them: then add of *Ground-Pine* four handfuls, *Germander* two handfuls; *Bears Ears* or *French Cowslips*, one handful; boyl them in a double Vessel for three hours. *Ground-pine may be used many ways*

Others take *of Groundpine gathered when it first beginneth to flourish, and well kept, one handful; Wine three pints; boyl them in a double Vessel five hours, and then strain them.*

But it were far better; if the Herb aforesaid were tund up with the new Wine, and there let lie; that so in this manner a *Chamædryte* Wine may be provided, without any boyling at all.

And if any fear the Wine, he may in the like manner prepare an *Hydromel*, or a *Chamædryte* beer likewise.

Now the use of this Wine is to be continued (and so likewise of the Hydromel, or the Beer) for threescore daies, the Body being first well purged; and every day during the time one draught is to be taken in the morning.

And the like may also be made of the Essence of *Ground-pine* (as they call it) and this must be made use of for many daies.

But it is not here my meaning that any should be kept and held unto certain forms; but I would have those Medicaments to be made up, and compounded, according as occasion and the Constitution of the sick person shall require. The chief and principal Simples out of which these Medicaments are compounded (as appeareth by the forms hitherto prescribed) are, *Germander*, most useful in all the Affects of the Joynts, (and therefore by some it is also called the *Arthretick* or *Gout Ivy*) and *Lobelius* of one dram hereof with Turpentine maketh Pills, and greatly commendeth them in all Gouts whatsoever; and then in the next place, *Groundpine*, of the Virtues whereof we have before spoken; St. *Johns wort*, *Round* and *long Aristolochy*, the *lesser Centaury*, the *true Rhapontick*, *Gentian*, *Spignel*; and the *Root* of *Mugwort*, if in stead of the *Parsley Roots* it be boyled with meat, (by the use of which alone many have been freed from the pains of the joynts, as *Abraham Seylerus* writeth in *Scholtzius* his *Consilia*, *Consil.* 335.) unto which may be added the *Bones* of a *Man*, *Coral*, *Crabs Eyes*, with the rest that have been already mentioned, according to every ones constitution. *Simple Medicaments.*

For *Aetius* doth here rightly admonish us, as touching Treacle, and the like hot Medicaments, that they do not only not benefit those that are of a more hot Constitution and temperament; but that they likewise oftentimes produce Resolutions that prove incureable. But here indeed there are some that determine this to be understood only of such as are hot in the highest degree; because that *Galen* also (in his *fifth Book of the preservation of health*,) expounding the words of *Hippocrates*, (in which he forbiddeth the drinking of Wine unto those that are hot,) writeth, that this is not intended of all absolutely that are hot, but that *Hippocrates* spake it of such as were hot in the highest degree: but yet most certain it is, that great heed is here to be taken unto the diversity of Bodies and temperaments; and that hot Medicaments are more conveniently also given in *Autumn*, then in the spring time; and therefore in Bodies that are more hot Succory is wont to be intermingled with the Medicament: and as touching *Succory*, *Adrian Spigelius* likewise writeth, that he had been taught by experience, how that in a hot Cause there was nothing more convenient then the Leaves of *Wild Succory*, gathered in the month of *May*, and dried in the shade, and then given one dram thereof, for the Dose. And yet nevertheless the *Roots* of the said *Succory* are likewise very useful, if they be pulled up in the first beginning of the Spring; and the same may also as well as the Leaves be mingled together with those other Medicaments that we mentioned before.

But now in what manner these pouders and *Artipodagrick* Medicaments (commonly called Antidotes) do benefit those that are troubled with the Gout, is well worth our consideration; and as touching this very thing *Thomas Erastus* moveth a Question;

How the Antipodagrick Medicaments do benefit such as have the Gout.

Queſtion; which is this, viz. how thoſe Medicaments can correct the cold and moiſt diſtem per of the Head, or diſſipate humors bred therein. But the truth is, he moveth this Queſtion out of an Anticipated Opinion and *Hypotheſis*, whiles he preſuppoſeth that the humors (the Cauſe of the Gout) do fal down out of the Head; which that it is falſe, we ſhal anon ſhew you in the ſeventh Queſtion. Whoſoever he be that rightly underſtandeth the Cauſe of the Gout may eaſily perceive what the Phyſitians main ſcope is here in the adminiſtring of the Antidotes. For ſeeing that thoſe Tartarous humors are generated in the firſt and ſecond Concoction, and then are derived into the Veins, and at length in their own time thruſt forth into the Joynts; in the adminiſtring of the Medicaments the ſcope that the Phyſitian here propoundeth unto himſelf is this, to wit, that he may promote and help forward the Concoctions of the Stomack and Liver; and if there be any excrements generated in the Stomack (as *Eraſtus* alſo confeſſeth that there are) and in the parts neer adjoyning (to wit, the Meſeraick Veins, the Spleen, and the Liver) theſe do cleanſe them away, conſume them and diſſolve them into exhalations, and evacuate them by Sweats, and Urines: and *Carolus Piſo* writeth moſt truly, that the pores and breathing places of the Skin (whether ſenſible, or elſe even inſenſible) is ſo greatly to be accounted of, that in it alone there ſeemeth to be placed the whol buſineſs of preventing all kind of Arthritick fluxions. And this is excellently done by thoſe Medicaments, if they be continued.

Whether the Decoction of Guajacum and the like, do perform the ſame that the Antipodagrick Medicaments do?

But now here it may (not without Cauſe) be demanded, whether or no the very ſame may not be performed by the Decoction of Guajacum Wood, Sarſaparilla, China, and the like; ſeeing that even thoſe alſo do exceedingly provoke Sweats; whereupon the uſe of theſe Decoctions is by many preſcribed in this Diſeaſe of the Gout. But yet leaving every man to enjoy his own Opinion, for my own part I am altogether unſatisfied in this point. For (as *Crato* ſaith truly in his 25. *Epiſt.*) thoſe Sudorifiques (eſpecially ſuch as are made of Guajacum Wood) if they be frequently adminiſtred, do very much conſume and waſt the Radical moiſture, which is not in the leaſt done by any of the afore cited Medicaments; which do only cleanſe the humors, and diſcuſs them by a moiſtneſs and dewineſs all the Body over in the morning, or by a gentle and light Sweat, or elſe alſo diſperſe them inſenſibly. And beſides, ſuch Decoctions as theſe when they are taken in a great quantity do very much dry the Bowels, which of themſelves are for the moſt part over dry in thoſe that are afflicted with this Malady. Add to this, that thoſe Antipodagrick Medicaments before ſpoken of are moſt of them bitter; and thereupon they obtain a virtue and power of cleanſing away thoſe tartarous humors, and Cholerick Ichores that are collected about the Liver and Spleen; which virtue and faculty theſe Decoctions laſt mentioned do want; ſince they do only extenuate, dry, ſcatter the humors, and provoke Sweats. And hence it is, that *Johannes Crato* (in his 253. *Conſil.*) not without good Cauſe tels us, that to follow the Vulgar Opinion is no leſs to be deceived, than by placing any hopes and expectation in thoſe potions of China, Sarſaparilla, and the like Decoctions. For if they at any time ſeem to benefit, and yield any help, this they do by means of the exact and ſtrict Dyet that is then obſerved: and the moſt of thoſe Perſons of quality that have ſo often drunk thoſe Decoctions have been greatly deceived by the perſwaſions of others, and therefore they may do wel to ſee to it, that they may ſtumble no more at the ſame Stone. And therefore at all times if there be any vitious Conſtitution in the Bowels, and a power generating that humor, we ought carefully to look to it, leſt that by the uſe of ſuch like Medicaments that aforeſaid power ſhould be augmented; as it is moſt certain, that that diſpoſition unto the Stone that is in the Reins may be greatly increaſed by hot and dry Medicaments unſeaſonably given to break the Stone. And *Monardus* likewiſe (in the 16. B. of his Epiſtles) writeth that Guajacum doth wonderfully dry; and therefore muſt needs be very hurtful for ſuch as are of a dry temperature.

The Chymiſts do here likewiſe commend their Medicaments: and ſome of them write, that the *Arcanum* or Secret of Tartar doth remove, and by the very Roots take away the Gout: Now it is made in this manner.

The Arcanum of Tartar.

Take *Salt of Tartar depurated, or puriſied; from this draw away a diſtilled Vinegar, again and again (alwaies receiving the new) until ſuch time as it leave behind it no more at all of its ſharpneſs and Tartar. And then unto one part of this Salt add three parts of common Bole, and ſo diſtill from thence the Spirit by a Retort of Glaſs wel Luted, and fitting thereunto a Veſſel to receive, and let this be big enough. Unto one part of this Spirit pour in two parts of the Spirit of Wine, an eighth part of the Oyl of Sulphur; and a ſixteenth part of the Oyl of red Vitriol. All of theſe being wel mingled together in a Glaſs Sealed after the Hermetick manner, let them for three months be continually circulated.*

Fryar

Fryar *Basil Valentine* doth with great Praises extol the Spirit of quick or unslaked Lime. But as the Composition of this is very difficult and troublesom; so we have likewise just Cause to fear, and wel to consider, whether or no it doth not easily offend the Bowels; seeing that there is in the Salt of quick Lime a notable and manifest Caustick quality; which appeareth even by the potential Cauteries that are made out of the Ley that cometh from the said unslaked Lime. *The Spirit of quick Lime.*

And so indeed Issues do likewise dayly evacuate some of the serous humor, or a certain kind of Sanies, and thin Excrement: but Experience doth testifie, that this Remedy is not in the least to be compared with Sweats and insensible transpiration: and it is wel known that many have had some of these Issues made, and yet nevertheless they have been afflicted with the Gout, in regard that they are not sufficient to draw forth that whol humor that is in the Vessels; and much less can they evacuate that which is from day to day collected about the Bowels, and is afterwards by the Veins poured forth into the Joynts; and especially if there be committed any errors in the Course of Dyet; and chiefly if there be an excess in Drinking. *Issues.*

But yet nevertheless, if the Gout hath its Original from some old and long continued Ulcer that is consolidated in the Thighs, and the suppressed Evacuation of the *Ichor* that was wont to flow forth thereby, then in this case it wil not be amiss, but to very good purpose to make an Issue in the Thigh. And so likewise, if upon sudden stopping and healing of an Issue in the Arm there happen any fits of the Gout to arise, the Issue is then again to be opened.

What things they are that strengthen the Joynts.

The third head of preventing the Gout consisteth in the strengthening of the Joynts (as most Physitians tell us) that so they may not too readily and easily receive the humor flowing unto them. But *Carolus Piso* (as we likewise told you above) thinks that here in this thing much pains may be taken to little or no pupose, it being not within our power (would we never so fain) since that as he conceiveth, that weakness doth not consist in any distemper, or hollowness, and looseness, but in the Natural conformation, and termination of the Vessels into the extream Joynts. And although that even by this means also we may hinder and prevent that humor from flowing into the Joynts: yet he determineth that the sick Person is so far from receiving any benefit from hence, that he may also by this means be brought into great peril and hazard of his life, the matter being translated unto the Lungs, or some other noble Bowel. But in very good earnest, it is not a thing to be sleighted and nothing accounted of, that the humors chiefly flow into the Joynts, in regard that the Vessels are terminated into them: and if the matter that was wont to flow into the Joynts be transferred into the more noble Members, the sick Person may then be cast into great dangers; and as we told you above (among the Prognosticks) it is a very il sign, if the matter that was wont to flow unto the Joynts subsist and abide stil in the Body. And therefore we are not wholly to rest and confide in this Remedy, or manner of preventing the Gout; without using the utmost of our endeavor that those vitious humors may not be generated in the Body; or if they be already bred there, that they may be frequently evacuated. And yet however this is also a certain Truth, that if the Joynts be weak and ill disposed, the sick Persons are then the more frequently troubled with the fits, and not so easily freed from them. But now, in what this weakness of the Joynts especially consisteth, we have shewn you above; and we shal likewise shew you further in the eighth Question. And therfore if there be any thing in the Joynts, either left there after the Paroxysm, or collected from some vitious Nutriment, it is to be consumed; and so the Joynt hath its own Constitution and Natural temperament restored; and thus it is said to be strengthened. And therefore the Medicaments that are here useful must be Astringent, and moderately heating and drying. And yet notwithstanding such Medicaments as these are not to be administred, until al the pain and swelling be wholly vanished, and that the hard knobs likewise disappear. For whilest these are in being, Astringents do more hurt than good, in regard that they drive the humor into the part affected, and there harden it. *The third Member of preservation is the strengthening of the Joynts: whether it be necessary, or not?*

But now for the strengthening of the Joynts, and the consuming of the Reliques of the humors that are in them, the use of Grape Kernels is by many commended, as that which affordeth much benefit; touching which since that *Antonius Donatus ab altomari* hath written a whol Book, the Reader may consult the same (if he please) for his further satisfaction. This only we shal desire him to take notice of, that they are most convenienely used in the Vintage time, while they are new, and they must be such as are taken out of Grapes that are through- *The benefit arising from Grape Kernels, in the strengthening of the Joynts.*

throughly ripe: of the which seeing that in many places there is no great store, other Medicaments may be made use of instead of them. Yet notwithstanding there are some that likewise use these Grape-stones dried; and they boyl them in red Wine and Water; and while they are boyling, they add to them Sage, Betony, Germander, Primrose, and other such like Herbs; as also Earth-worms.

Baths strengthning the Joynts.

Baths do likewise corroborate the Joynts. For although they be by some rejected, in regard that by their actual humidity and heat they attract the humors unto the feet; yet nevertheless this inconvenience may easily be prevented, if Plants that heat and dry, and strengthen the feet, be boyled in the Water; such as are Betony, Sage, Germander, Roses, Cranesbil, Heath, Oak Leaves, the Wood and berries of Juniper, and the Fruit of the Mountain or wild Pine-tree.

Andemacus his washing of the Feet (which as he writeth, hath profited many that have made trial thereof) is in this manner:

Take *Lye made of the Ashes of the Beech, which is to be strained three or four times; and then add thereto as much Wine, and Allum two ounces; and heat them at the fire.* Or,

Take *Mugwort. Wormwood, Organy, and Camomile flowers, of each two handfuls: Allum, and Salt, of each one handful: Lye of the ashes of Beech, as much as will suffice; and boyl them together for a bath.*

And so likewise for the strengthening of the Joynts, very good and useful is a Bath of Juniper Wood, if the branches thereof be boyled in Chalybeat Water, until the Water be dyed and colored thereby, and hath even gotten the color of the Lye. And yet nevertheless there may also be added some ounces of Salt or Allum.

After the Bath the Joynts are to be anointed with the Oyl that is pressed forth out of the Grape Kernels, or the Oyl of Myrtle, or Roses, or some other such Oyl; touching which more anon.

Hot baths strengthen the Joynts

But hot Baths are by many most especially commended, although they be disallowed of by others; of which we shal speak further in the twelfth Question. And so likewise the Baths that proceed from Sulphur, Salt, Nitre, Vitriol, (and partly also Baths of Allum Water) are very useful if they be made use of in a due and right manner. For if the Allum abound, the Baths are then to be made use of with great Caution, in regard that they shut the pores of the Body, and render it unfit to sweat, a thing altogether necessary in such as are troubled with the Gout; and if there remain any thing in the part affected which may exhale, and be dispersed by insensible transpiration, they thrust this forth unto the Nervous and Membranous parts, and so renew the pain; the same that happened to *Fabricius* in his 5. Century, Observat. 83. Among the rest, the Hirschergensian, and Laudeccensian hot Baths in *Silesia*, the Caroline in *Bohemia*, the Badensian in *Austria*, the *Martiate* (now called the Wisbadensian baths) the baths not far from *Mentz*, and those likewise at *Emsen* upon the River *Lanus*, as also those of *Aquisgran* are al of them very useful for those that have the Gout. But the Dirt or Clay of some certain Baths is chiefly to be made use of for the wasting away of the matter that sticketh in these parts, and strengtheneth the said parts.

Where such baths are wanting, Fomentations and artificial baths may be made. The Lotions or washings of Allum Water are very much commended; but yet it is far better that there be Salt and Sulphur added unto the Allum, that so if there be yet any of the matter left behind, it may be resolved. Or,

Take *Flowers of Arabian Orrace, of Sage, Thyme, Cranesbil, of each one handful; boyl them in common Water, or (which is better) in Water wherein Iron hath been oftimes quenched: and to the straining add Sulphur and Nitre, of each two ounces; Allum one ounce: Let them be boyled again, and the parts fomented with the Decoction.* Or,

Take *Leaves of Germander, and Betony, of each one handful: Flowers of wild Roses, Arabian Orrace, Bears Ears or French Cowslips, the common Doves foot, of each two handfuls; white Vitriol one ounce: boyl them for a Fomentation or a Bath.*

Unguents and Emplasters

But the most ordinary and usual Remedy (that is made use of by many) is the Unguent we mentioned also before, where we spake of the Cure; which is made of Salt corrected or dried to a pouder (others are rather for the Salt of *Juniper*) and a sufficient quantity of common Oyl, or Oyl of Roses, mingled into the form of an Unguent, with which the Joynts are to be wel rubbed.

Solenander maketh use of this Liniment after the Lotions.

Take

Take *Oyl Omphacine two ounces; Oyl of Mastich one ounce; Salt dried to a pouder two drams; Bole Armenick three drams; Dragons blood, and Hypocistis, Frankincense, and Mastich, of each two drams and half. Let every one of these be first beaten into a fine Pouder by themselves: and then let them be mingled together with the Oyls in a Mortar into the form of a Liniment.*

The Emplaster *Diacbalciteos*, or as some cal it, the Emplaster *Diapalma*, laid on, is here likewise very useful. And this Emplaster is fit and proper in al the joynts, whatsoever the humor be that floweth unto them. And *Solenander* in his 4. *Sect. Consil.* 25. writeth, That he knew divers, who before were wont very frequently to be troubled with fits of the Gout, that by the continual use of this Emplaster, and by taking Purges now and then, were for the space of five whol yeers freed from those pains. And this Emplaster it neither defileth the part whereon it is laid, neither doth it cause any itch, or raise pushes; nor is it at al offensive, either in its smel or any other quality. Now it is fitted to the form of the Member. In the Feet shoes are made of thin Leather (but the Fox skin is more approved of) which within are to be covered over with the Emplaster *Diachalcitis*, and so they are fitted to the feet. The same Leather spread over with this Emplaster may be applied unto the Knees, Hand-wrists, and other parts. And Linnen Socks likewise washed in Wine with Water, then dryed, and drawn upon the Feet, are very useful and convenient.

Thomas Erastus commendeth the Sand stone (the Latin Physitians cal it *Lapis Sabuli*) if it be mingled with the Oyl of Myrtle, and Gentian Roots reduced into a Pouder, and laid on in the form of a Cataplasm. But yet the same *Erastus* adviseth us not to use it until it shal manifestly appear that there is no Excrement remaining in the Joynts, that may be hardened into a Tophus. And therefore he perswadeth us first of al (before we use it) to lay on once or twice the Cerote of Briony, described by *Aetius* (*tetrab. 3. Serm. 4. chapt. 43.*) that so there may be the less danger; and this *Aetius* very much commendeth.

But now as touching al manner of Topicks for the strengthening of the feet, this is to be observed, that for such as wil keep no orderly nor regular course of Dyet, neither use convenient purgations, and other evacuations, these Topicks if they be administred, it wil be without any benefit at al, yea, oftentimes to their great detriment and hurt: but unto such as live temperately, and use fit and proper Evacuations, they are administred with singular benefit and success.

Cutting out of the Veins.

Aetius (in the place alleadged, Chap. 24.) for the preventing of the Gout, commendeth also the cutting forth of the Veins that are from the superior parts carried down into the feet, done after the same manner as the *Varices* or crooked Veins in the Thighs are somtimes wont to be cut forth. But as *Hieronymus Fabricius ab Aquapendente* tels us rightly (in his *B. of Chirurgical Operations*) the extraction and excision of the *Varices* is not only harsh and difficult; but that for the most part also it succeedeth unhappily, by reason of the blood flowing out. And moreover, from this cutting forth of the Veins the lower parts are soon brought into a wasting and withering condition. And besides al this, although these Veins be cut forth; yet there is but very little benefit to be expected from thence. For if vicious Humors be heaped up in the Body, and be accustomed to flow unto the feet, their way and passage being shut up, they are carried unto some noble part, and there they may excite some other affect far more dangerous.

There may likewise, for the strengthening of the Joynts, internal Medicaments be administred; to wit, those which are appropriate unto them, as *Germander, Ground-pine, or Herb Ivy, Betony, Primrose, Sage, Rosemary*, and others of this kind, as we mentioned them before.

And this is the way and means to prevent the Gout; as *Rhases* seems in few words to comprise it, whilst he thus writeth: *If the person troubled with the Gout shall observe a good and orderly course of Dyet, and govern himself as he ought in the six things not Natural, and shall somtimes use Mithridate, or somthing else that may consume all the superfluities, and shall likewise make use of Stipticks about the place of the Joynts, this person shall be relieved.*

Chap. 8. *The Physitians Consolation in the Gout.*

Comforting the patient in the gout.

IN regard that such as are sick and diseased desire and expect from the Physitian, not Consolation, but advice, and the best of his assistance; it may seem to be besides the

Office and business of the Physitian to write any thing touching Consolation in the Gout: and indeed I should not at al have published any thing of this Nature, had I not found the same done by that famous and most eminent Man *Johannes Crato*, my fellow Citizen, and Physitian unto three Emperors, in his *Consil.* collected by *Scholtzius*. Him therefore I now shal follow, and speak somthing as touching the subject aforesaid. For oftentimes indeed Medicaments and helps of al sorts are administred unto the sick person, and yet nevertheless the Physitian doth not so obtain what he desireth. And somtimes likewise the sick party (either in respect of the condition of his life, and imployment, or else also in regard of some other parts of his body) cannot so exactly as he ought observe what is enjoyned him by the Physitian; and therefore albeit the sick person cannot then conceive any hopes of a perfect Cure, yet notwithstanding he may have somthing to comfort himself withal.

I. First of al therefore, The Gout preserveth from many other Diseases and Maladies, and it is a sure sign of the strength of Nature; which driveth forth the vitious humors in the body, out of the high way, and common road (as I may term it) or (if you wil) the principal passages, unto the extream and more ignoble parts of the body; and on the contrary (as we likewise acquainted you before in the Prognosticks) if Nature be weak, and sink under the burden, as being no longer able to expel forth these humors, then Feavers and other dangerous Diseases are wont to follow. And hence it is that Physitians (and some of them of great note) are of Opinion that the Gout many times maketh for the lengthening of the life; and that if it be ill cured it hasteneth on death. For Nature (as we said erewhile) driveth the vitious humors unto the Joynts. But if (the body being not sufficiently purged, or when there is no exact course of Dyet observed, or by reason of the long continuance of the disease, or else by reason of age) the strength be weak, and the Physitian shal then busie himself only in strengthening of the Joynts, it may easily happen that the matter which Nature was wont to thrust forth unto the Joynts, if it be stil retained in the body may be turned unto the principal parts, and so may excite dangerous Diseases, yea, and hasten on death.

II. A man all the while he is troubled with the Gout is in no danger of his life (as in other diseases he might be, to wit, burning Feavers, and others, spitting of blood, the Pleurisie, Impostumation of the Lungs, Dropsie, Epilepsie, Apoplexy, and many other) but after a short time the Man returneth unto his wonted imployments, and is oftentimes so well recovered, that there is not the least appearance of his being sick.

III. If likewise there be any thing in the World that may perswade Man unto temperance and sobriety, the Gout chiefly doth this. For whenas the pain in the Gout is most raging and intollerable, and that the Gout cannot by any thing be better prevented or mitigated, than by a frugal Dyet (and in this we find al Physitians to agree, and we have also a testimony of it from Experience it self) which causeth that not only no matter may be supplied for the encrease of the ill humors; but it likewise best of al correcteth the distempers of the Bowels: and it is the part of a prudent man rather to obey Reason than his Affections, and not to forget that of the Poet.

Pleasure with pain
Is loss, not gain.

and he ought to consider likewise that that pleasure which he taketh in a more free and liberal Dyet, is not worth, neither wil it compensate those so great pains and wrackings that must be endured in the fits of the Gout. And although it seem indeed somwhat grievous to shun al feastings, and company-keeping, yet this must be thought of, That none of those boon Companions can afterwards afford any the least help in this Disease; but that (as *Lucian* hath it in his *Tragopodagra*, about the end thereof) they wil rather laugh at, and deride a man in his pain and misery. Yea, moreover, whilst that for fear of the Gout a man accustometh himself unto a good and orderly Dyet; he doth not only prevent the pains of the Gout, but he avoideth likewise many other Diseases that proceed from the Errors in the Dyet; and a Man hereby oftentimes attaineth unto old Age. But as for such as either wil not submit themselves unto the Rules of Dyet, or else by reason of their condition of life and imployment cannot observe the same, let not these accuse either the Physitian, or the Physick, but let them blame themselves; since that (as *Galen* writeth most truly in his Tract of Curing by letting blood, Chap. 7.) *To prescribe Medicaments* (saith he) *unto that party which neither can, nor will observe an orderly and due course of Dyet, is altogether in vain, and to no purpose.* But now if a man observe a good Dyet, although he be not wholly freed from this Disease, he yet may then comfort himself in a good conscience,

and

and rest himself contented in the will and good pleasure of God. And hence it is, that *Crato*, in the *place alleadged*, writeth, that seeing diligent observation and prudent moderation in point of Diet hath been found to be alwaies helpful, and that it never hurteth or deceiveth any, to neglect it therefore may well be thought not only an Argument of the greatest folly and madness, but likewise of their neglecting and being careless of themselves, which Piety forbiddeth. And when we have the Testimony of our own conscience, that nothing hath been done by our own fault that might bring or increase the pain; it is then a very great Consolation, when we can perswade our selves that we are altogether blameless; and so can cheerfully endeavour in a right manner to bear what is necessary and could not be avoyded, and not to repine and murmure against God.

IV. And this also may comfort such as are afflicted with the Gout, that as every one hath his proper Calamity; so likewise every man hath a Commodity properly belonging to him; and that the Gout is said to be the Rich mans Disease. For although those that are troubled with the Gout do indeed suffer a great pain: yet most of them are such as have a plentiful Estate, or at least they have what is sufficient; whereas on the Contrary, there are many who although they be free from this pain, yet they lie under other daily pressures and grievances, by Reason of their poverty. The Gout (as *Cardanus* in his *Encomium of the Gout* writeth) smelleth and is sensible of sweet Unguents, heareth Songs and Musick, lyeth (proud as it is) in soft beds, upon Silken Pillows, betwixt Gold, and Pearls, and painted Tables, heareth Tales and pleasant stories, tasteth generous and Rich Wines, and the more delicate and dainty kind of Meats. It hath presented unto it pleasant and delightful flowers. Embroydered garments, and whatsoever hath ambitiously for many years been heaped up by wealthy Citizens, or even by Kings themselves. And the Gout is so far blessed, that he who is detained thereby, besides the pain it self, hath nothing to hinder him from living a happy life.

V. Those that are troubled with the Gout may likewise comfort themselves with this, that those higher faculties of their Souls and the operations of their minds are not corrupted and hurt in this as they are in most of the other Diseases; but for the most part these continue safe and sound. And the very truth is that for most of the Monuments of the Learned, we owe them unto the Gout; for had these men alwaies had their health, they had never published so many voluminous and learned works. And (as *Cardanus* in the *place alleadged* writeth) *Erasmus, a man of extraordinary great parts and learning, in our own age, while he lay diseased of the Gout, and by Reason of it kept his bed; wrote and published whatsoever of his is worth our reading.*

VI. There is likewise another great benefit and commodity that the Gout bringeth along with it, to wit, that it freeth a man oftentimes from many other troubles; and keeps off much Vain and fruitless labor, as also many grievous and disquieting Cares, (that I may use *Cadans* own words) so that if a man be required to serve a Tumultuous Common-wealth, or to give his attendance upon a pettish and froward Prince, or some imprudent friend, how can he better excuse himself, then by his having the Gout? He that hath the Gout hath the greatest part of the year at his own command: and there is no better nor honester excusing ones self from work, then by the Gout. And when there is occasion of a mans going abroad in publick to serve his own turn, it is but saying, that the Gout hath left him.

VII. And Lastly, although by art, and a good course of Diet, much help may be hoped for; yet never the less in regard that the temper of the Bowels by the long continuance and grievousness of the pains is so subverted, and the Joynts so weakned, that there is no hopes left remaining of a perfect recovery of the health, the sick person may yet in the mean time enjoy those benefits and comforts that we have mentioned, and with Patience establish his mind, after the example of that great Emperour *Charls* the fifth, who was wont to say, that to be Patient, and not much to complain and cry out by Reason of the pain, are the best Remedies against the Gout.

But seeing that it is not the part of a Physitian, (but a thing much unbeseeming him) to make himself merry with the Disease and pains of his Patient, I shall forbear to add any thing more of this Nature. But if there be any one that desireth to know

know any Elegant and conceited Jeſts upon the Gout, let him read *Lucian* his *Tragopodagra*. Which is likewiſe wel worth the Phyſitians reading, ſince that it doth moſt emphatically expreſs the vehemency of this Diſeaſe, and ſhew the Cauſe thereof (and that indeed more rightly then many Phyſitians) and Elegantly deſcribe the time of its invading the perſon, the difficulty of its Cure, the bragging and vain promiſes of Empericks, and laſtly the Patience that is neceſſary and Requiſite for the ſick Perſon.

QUESTIONS Controverted Touching the Gout.

Queſtion, 1. *Whether the Name of* Arthritis, *or the Gout, Comprehend likewiſe the Gout* Podagra, Chiragra, *and the reſt of the pains in the Joynts?*

WE have told you before that *Arthritis* is ſo called by the Greeks from *Arthron* (ſignifying a Joynt) and that therefore it very fitly agreeth with all the pains of the Joynts, (of which we have hitherto ſpoken,) but by the Barbarous and common Practitioners it is called alſo *Gutta*, but not ſo properly. And yet notwithſtanding there are ſome even of the latter Phyſitians (and among the reſt, *Franciſcus India*, one of the Phyſitians of *Verona* a City in *Venice*, in his *firſt B.* of *Gutta Podagrica*, *Chap.* 1.) who deny this Name of *Gutta* to be Barbarous and improper, it being as it were the general Name for all Diſeaſes which by deſtillation are produced in the Joynts of the Feet, Hands, Hips, and the like parts of the Body, and that therefore it deſerveth to be the general Name; but they write that *Arthritis* cannot properly be applied as a general Name unto the Gout *Podagra*; becauſe that *Galen* tels us (in the *Sixth Section of the Aphoriſm. Aphoriſ.* 28.) that almoſt all thoſe that are troubled with the pains of the Joynts are firſt of all taken with the Gout. And there are likewiſe other Phyſitians that make the pain of the Joynts ſome other, and altogether diſtinct from the *Podagra* and the *Chiragra* Gout. *Cardanus* (in *Aphoriſm.* 29. of the *Sixth Section*) writeth, that the Diſeaſe of the Joynts and the *Podagra* are not one and the ſame Diſeaſe: and he addeth, that he had ſeen many Children that were troubled with the pains of the Joynts, but not one of them that had the Gout; and that he remembereth not that he had ever read any Author who had ſeen it; and he reprehendeth *Galen*, for that he maketh no difference between *Arthritis* and *Podagra*.

But *Luc. Mercatus* (in his *fourth B. of the Curing of internal Diſeaſes*, *Chap.* 18.) handleth this ſame ſubject at large, and diſtinguiſheth *Arthritis* or the Diſeaſe of the Joynts, from *Podagra*, *Chiragra*, and *Iſchias* or the *Sciatica*; and he teacheth us that the *Arthritis* hath a Nature peculiar unto it ſelf, which conſiſteth not in pain, but in this that it ſeizeth on all or moſt of the Joynts; as alſo that *Arthritis* doth not require that weakneſs of the Joynts which is neceſſary in *Podagra*, *Chiragra*, and *Iſchias*, but that a far leſs imbecillity doth ſuffice: and on the contrary, that it requireth a far greater ſtore of matter; and that it is much more rare then the Gouts, *Podagra*, *Chiragra*, and *Iſchias* or the *Sciatick* Gout: and that *Arthritis* hath likewiſe this proper and peculiar unto it, that it beginneth with a ſwelling, and endeth in a pain; whereas in the *Podagra*, *Chiragra*, and *Iſchias* the quite contrary happeneth; and the part is firſt of all taken with pain, and then afterward it

ſwelleth:

ſwelleth: and moreover, that it doth not require fourty daies ſpace for its reſolution, and that becauſe the parts are leſs weak and infirm, and becauſe that the Humor ſticketh in thoſe parts that are more fit for reſolution: and Laſtly, likewiſe, that it moſt ſeldom or never returneth, in regard that all the matter is diſcuſſed, and wholly Rooted out; unleſs haply that by an intemperance and irregularity in the life, it collect a new fulneſs of matter. For he determineth that the cauſe of the *Arthritis* is peculiar, to wit, the internal, a fulneſs of the Veſſels, and more eſpecially of the blood; but the external is every occaſion that bringeth labor and unwonted exerciſe to the Joynts, by the which they become hot, looſened, and dilated; and the Humors poured all abroad waxing hot, and ſtird up and down flow together in theſe Joynts; which the part weakned and made looſe doth very eaſily draw unto it, and receive it.

But (as for the opinion of *Franciſcus India*) the very truth is, that the Word *Gutta* is a Latine Word, and not Barbarous; but yet to uſe it for a fluxion and Catarrh, or for *Arthritis*, is contrary to the uſe of the Latine Tongue; and therefore he may very deſervedly be accounted for no better then Barbarous that ſhall uſe this word for *Arthritis*, or prefer it before the Word *Arthritis*. And although that *Galen* (in his *ſixth of the Aphoriſ.* and 28. *Apho*.) doth indeed affirm, that almoſt all that are taken with the *Arthritick* affection (that is to ſay, the pain in the Joynts) are ſuch as have firſt of all been troubled with the Gout, yet nevertheleſs this doth not prove, that the Name of *Arthritis* fitteth not unto every pain of the Joynts: for there are likewiſe Joynts in the Feet. And as we told you above (in the *firſt Chapter*) this Name in general is ſomtimes taken in ſpecial for that Diſeaſe of the Joynts, when all or moſt of the Joynts are affected; which happeneth not, unleſs a man be firſt taken with the Gout *Podagra*. But more rightly *Guainerius* (in his *Tract of the Diſeaſes of the Joynts, Chap.* 1.) *I* (ſaith he) *when I ſaw that the* Arthetica (*for ſo all the Phyſitians of that Age by Reaſon of their ignorance of the Greek Tongue called this Diſeaſe*) *had its Name from a Limb or Joynt, (in which places the pains of the Joynts are wont to be) was willing to call all ſuch like pains (whether with a ſwelling, or without) Arthetick, like as alſo all that ever were before me have done.*

But as for *Cardanus* and *Mercatus*, I ſee no cauſe at all why they will not have the Gouts, *Podagra*, *Chiragra*, *Gonagra*, and the Sciatick pain, and al other the pains of the Joynts, to be comprehended under the Name *Arthritis*, as a *Species* under its *Genus*; or if the moſt or all of the Joynts be troubled with the like affect with that wherewith the Feet, Hands, Knees, and Hip are wont to be grieved; I know no reaſon (ſaith he) why it may not be called *Arthritis*. But this in the mean while we deny not, that every Diſeaſe of the Joynts, or every ſwelling are not properly called *Arthritis*; and that it ſomtimes happeneth, that other vitious Humors, (and not the blood, as *Mercatus* will have it) altogether of another kind from thoſe that produce *Arthritis* properly ſo called, may be heaped up in the Body; and that they may ſomtimes with, and ſomtimes without a feaver, be driven unto the parts nigh unto the Joynts, and may there excite and cauſe ſwellings, and ſomtimes alſo pains: which ſwellings notwithſtanding are not properly the *Arthritis*, ſeeing that (as *Mercatus* himſelf hath determined) they do not begin from pain, and end in a ſwelling; but on the contrary, they begin with a ſwelling, and then afterwards there cometh a pain. How much leſs then are theſe ſwellings alone worthy of the Name of *Arthritis*; and on the contrary, this Name to be denied unto thoſe pains of the Joynts, of which we have hitherto been treating: Eſpecially ſince that thoſe ſwellings do not return (as the Gout doth) by certain intervals; but although they have once or ſo infeſted and diſquieted any perſon, yet they may afterwards never again return all the whole life long. And therefore if *Cardanus*, *Mercatus*, or any others, will likewiſe have theſe ſwellings to be called *Arthritis*; let them know that the Ancients were not wont to call all kind of Tumors or Swellings, (were the cauſe what it would they ſprung from) and all kind of pains, I ſay, they were not wont to cal all theſe by the Name of *Arthritis*. And *Hippocrates* (in the *ſixth Epidem. Comment.* 4. *Text* 13.) calleth thoſe in *Ænos* that by exceſſive eating of Pulſe had gotten a pain in their Knees, not *Arthritick*, but *Gonalgick*, (that is to ſay, perſons Diſeaſed in their Knees) and touching this we ſhall ſpeak further in the Queſtion next following.

Queſt. 2.

Quest. 2. *Whether every pain about the Joynts deserve the name* Arthritis.

THere are indeed some of this Opinion, that every pain that happeneth about the Joynts is to be called *Arthritis*; since that if there be any other such like pains, they are no where expressed by any of the Physitians; neither hath any of them written of any pain of the Joynts that is not Arthritick. And although we may meet with some kind of seeming difference, either according to the greatness, or according to the duration of them (a shorter or a longer time) they conceive that this difference doth not at all vary the species or kind thereof.

But I think that *Galen* (in the third Section, Aphorism 15. and 16) writeth most truly; that if the filthiness be so great that it may dry up and consume the moisture of the Joynts, it may then indeed cause a difficulty of the motion, by reason of the drineſs in the Joynts, and that it may haply cause pain likewise; yet nevertheless it never produceth that affection which is called *Arthritis*; unless any one be minded to call all pains whatsoever of the Joynts by this name. For *Hippocrates* himself, for such as by the over-eating of the bitter Vetch *Orobus* and other Pulse had contracted these kind of pains, he doth not call these Persons Arthritick, but Gonalgick Persons. And therefore although we scarcely find any Author handling all such pains as these in any one place, yet nevertheless we find them treated of and mention made of them here and there, in several places of the same Author. For it very frequently so happeneth that vitious humors heaped up in the Body, may be by a Feaver (or else also without a Feaver) thrust forth into the Joynts, and more especially the Knees, and may there occasion pains which may oftentimes continue a long while; and such no doubt were those mensioned by *Hippocrates* in the place afore alleadged; which if not alwaies, yet when the sick Person desireth to move his Feet, they then excite Pain: unto which notwithstanding (to speak properly) the name *Arthritis* properly so called, doth not suit nor agree. So in such as have Dropsies and such as are Cachectick, or of an ill constitution, the serous humors falling down into the Feet may indeed excite there a swelling; and those very humors likewise when the Feet are moved may breed and cause much pain, which yet cannot be said to be the Arthritick pain. Neither doth the humor then flow into the part affected by and thorow the Veins, but it by little & little descendeth thereinto by the Pores in the Abdomen. And if we exactly weigh the matter, we shal find that such like humors as these do not seiz upon the very parts themselves that constitute and knit the Joynt together; but that rather a humor from without is poured forth and floweth round about these parts, and sticketh fast between the Skin and the parts constituting the Joynt. And so in the loosening of the Joynts in Wounds, and in Contusions, the humors do oftentimes flow unto the Joynts, and there cause a swelling and pain, which yet is not worthy of the name *Arthritis*. And to those that have their Joynts much dryed and hardened (as it is in the Scurvy and other Diseases) these Persons cannot stretch forth, nor move those Joynts without pain, and yet they are not to be accounted Arthritick Persons, neither do we call them so.

And therfore the *Arthritis* properly and in special so called, is only that pain of the Joynts, when the peculiar humor described above, bred in the Bowels of the lower Belly, and heaped up in the Veins and Arteries, by them suddenly floweth into the Joynts, and insinuateth it self more especially into the sensible and tender parts about the Joynts, and there partly by twinging, and partly by distending causeth pain.

Quest. 3. *In what place the humor that exciteth* Arthritis *consisteth.*

MAny indeed there are of this Opinion, that the humor the Cause of *Arthritis* doth consist especially in that Cavity or hollow space that is betwixt the extremities or heads of the bones (which by Articulation are joyned together) and that the humors flowing together by the Veins do first of all flow unto those Cavities of the Joynts, and that they then afterwards seiz upon all the parts lying round about, the Bones and the Skin; from whence it happeneth that the Bones sundering themselves, and departing one from the other, the Ligaments, and Nerves, and Tendons, are all of them so extended, that from thence there is excited a most vehement and wracking pain. And for this their Opinion they first of all alleadg that which *Hippocrates* writeth (in Sect. 6. Aphorism 49.) that the *Arthritis* is not ended before the fourtieth day, and that the humors that have flown unto the part affected are not sooner discussed as being such as stick in a part destitute of heat;

heat; whereas if they conſiſted in fleſhy parts, and ſuch as have many Veins and Arteries, they might eaſily be reſolved. And ſecondly, they go about to prove it by this, becauſe that from the afflux of the humors into the Cavities of the Joynt the bones are made to divide themſelves one from the other, and ſo by diſtending the Tendons and Membranes they cauſe the pain. Thirdly, becauſe that by the motion of the joynt the pain is encreaſed. Fourthly, becauſe that a pain is firſt of al perceived in the bottom of the part affected, before ever the external parts begin to ſwel; but that afterwards when the humors have gotten themſelves a way unto the outward parts, the external parts are then lifted up into a ſwelling.

But the contrary Opinion, which determineth that the fluxion is firſt of al made into the very parts incumbent upon the joynt (from whence they may haply ſomtimes, but this is very rare, ſwear through into the Cavity or ſpace of the joynt) is altogether more agreeable unto the Truth: and this we are taught firſt of al by the very breeding it ſelf of the *Arthritis*. For ſince that the afflux of the humor generating the Arthritis is by thoſe Veſſels that carry along the Aliment unto the parts (as we ſhal afterwards prove) it is neceſſary that the vitious humor that inſinuateth it ſelf into the joynt ſhould firſt of al flow into the parts lying upon the joynts, and keeping them cloſe together; and that from hence (if there be any great ſtore thereof) it may inſinuate it ſelf into the Cavity of the joynt. Secondly, the bones are ſo knit together by the ſtrongeſt Ligaments, that there is hardly any ſpace at all left into which the matter may inſinuate it ſelf. Thirdly, The Ligaments are very thick and ſolid, ſo that they wil not eaſily admit of the humors flowing in unto them; and much leſs wil they permit them firſt of al to flow into the very Cavity of the joynt. Fourthly, if the matter ſhould flow into the very Cavity, and the bones thereupon divide themſelves the one from the other, the Membranes would then be made longer; which yet we ſee is never done. Fiftly, in the knotty *Arthritis*, thoſe hard knobs that are ſomtimes taken out of the joynts, are not found in the ſpace between the bones, but about the Ligaments, and the parts encompaſſing the joynt. Sixtly, if the humor ſhould firſt of al flow into the very joynt it ſelf, and that it ſhould from hence be communicated unto the external parts, there would then be excited either no pain at al, or ſuch as would ſcarcely be perceived; in regard that the heads of the bones (in al that ſpace in the which they are knit the one to the other) are not covered with any *Periоſtium*, but only with a Cartilage; and there is no Membrane or Nerve at al in that place. Seventhly, the tumor or ſwelling that ſeizeth upon the external parts, and from the juncture of the joynt is ſomtimes extended far abroad unto the parts lying neer unto it, it ſufficiently teacheth us that the humor, the cauſe of the *Arthritis*, is not contained in the very joynt it ſelf, but in the parts about the joynt. And laſtly, if the humor ſhould be contained in the very Cavity between the bones, it could not be (which yet we ſee that it often ſo cometh to paſs) that cooling and repelling Medicaments ſhould forthwith drive back the humor from the place affected into the Veſſels, and from hence into other places.

And as for whatſoever they alleadg and bring for the contrary Opinion, it may be eaſily anſwered. For firſt of al, That the humors in *Arthritis* are oftentimes long ere they can be diſcuſſed, the cauſe is, not that the humors are contained in the Cavity between the bones; but becauſe they ſtick in places void of blood, and therefore having but little heat in them; and the humor it ſelf likewiſe is ſomwhat unfit to be perfectly diſcuſſed. Neither yet nevertheleſs is this alwaies true; for oftentimes alſo the matter is diſperſed and ſcattered in a very ſhort ſpace of time, to wit, when there is not much thereof, when it is thin, when the Part is cheriſhed with heat, and the matter not thickned by unfit Topicks.

And moreover, the pain is not therefore excited becauſe the Joynts are ſtretched forth in length, and made longer, and ſo are ſeparated one from the other, but becauſe that a ſharp humor flowing into the Membranous parts doth diſtend, and twinge them. And thirdly, although the pain be more excited while the joynt is moved; yet this happeneth not therefore, becauſe that the humor is contained in the very joynt (for as we told you but even now, this is void of ſenſe) but becauſe the Membranous parts about the joynt, being before preternaturally diſtended by the humor, are now more ſtretched forth. Neither laſtly doth that prove that the humor doth firſt of al fal forth into the ſpace of the joynt, becauſe that the pain, when the Diſeaſe firſt ſeizeth the party, is perceived to lie deep, before the external parts ſwel up, which when it happeneth the pain is mitigated. It is true indeed that theſe things do often ſo come to paſs, and that in the beginning there is very little or no ſwelling appearing, and that yet in the mean time the pain rageth in the top of the part affected, and

there becometh moſt grievous; which is afterwards aſſwaged when the external parts ſwel up. But this doth not therefore happen, becauſe that the humor falleth into the very Cavity of the Joynt, and from hence maketh it ſelf a way unto the exterual parts, the extream parts of the Bones being (as we ſaid before) altogether deſtitute of ſenſe; but it happene h from hence, that the whol vitious humor doth firſt of all by the extremities of the Veſſels flow unto the Nervous and Membranous parts about the Joynts, and greatly affl & them; but afterwards when part of the humor is likewiſe diſtributed into the fleſhy parts, the pain becometh more mild and moderate; when the humor is diſtributed into many places, it doth then act leſs powerfully; and thoſe parts are made more looſe and ſo are diſtended with leſs pain than otherwiſe: like as we ſee the very ſame to be in the pain of the Teeth, which at firſt is very great and intollerable, when all the humor floweth into the Teeth, and theſe Nerves inſerted into them; but afterwards when part of this humor is diſtributed into the Jaw lying neer, as likewiſe the Gums, then the pain is mitigated. But yet in the mean time (as we ſaid before) we deny not this that at length alſo even ſome of the matter may poſſibly ſweat through into the very Cavity of the Joynt, if the afflux continue long. Neither do the two laſt Aphoriſms of *Hippocrates* make at all againſt our Opinion; where (in the ſixth Section) he thus writeth: *Thoſe* (ſaith he) *that have been long conflicting with the pain of the Hips, if in theſe the top of the Thigh fall out of the Hip-Bone, and then return and fall in again, theſe have in that place a Mucous and ſnotty flegm collected. And again, they that by being vexed with a long continued Sciatica pain have the top of their Thigh fallen out of the Hip, in theſe the Thigh waſteth away, and unleſs they be burnt, they halt and become lame.* For that Joynt doth not therefore fall forth, becauſe that the Bone is thruſt out of its place by the humor fallen into the Cavity: but (as *Galen* in his Comm. upon the Aphoriſms teacheth us) becauſe the bonds of the Articulation being ſoaked and moiſtened by the flegmatick humor are thereby rendred more looſe.

But now what thoſe parts are about the Joynt that receive and entertain the humor that floweth unto them, neither do they al fully agree in their Opinions as touching this. *Capivaccius* and ſome others with him determine that this afflux is made only unto the Ligaments, and that in the *Arthritis* the Ligaments are filled ful, but not ſo the Nerves and Tendons; ſince that if theſe parts were filled there would then be Convulſions: for theſe parts come to be affected only by the conſent of the Ligaments, whiles that they are preſſed together by theſe Ligaments being filled with the humor. But the Ligaments are ſo hard and ſolid, that it is not credible that theſe eſpecially ſhould receive the humor flowing unto them, and be repleniſhed thereby. And the pain is not therefore excited, becauſe that only the Nervous and Membranous parts are preſſed together by the Ligaments preternaturally filled with the humor. For if this were the Cauſe, the pain could not poſſibly be ſo fierce and bitter; but becauſe that a ſharp and gnawing humor doth prick and twinge the tender and ſenſible parts. For as in other parts the Membranous *Perioſtia*, and Nerves, are the ſubject of the pain: ſo likewiſe in the *Arthritis* they contain the higheſt and moſt immediate Cauſe of the ſaid pain. But now that there is no Convulſion excited, we have already ſhewn you the reaſon thereof above, to wit, becauſe that the parts that are by Nature aſſigned for motion are not affected, but ſuch only as are appointed for ſenſe, as the Membranes, or the Nerves likewiſe themſelves (ſuch of them as are not deſtined unto motion) according to the Membranes.

Queſt. 4. *What kind of Feaver that is that accompanieth the* Arthritis.

THere are indeed very many that aſſert this Feaver to be only ſymptomatical. But ſince ſymptomatical Feavers are thoſe properly which follow the Inflammations of other parts (and more eſpecially the Bowels) to wit, when that heat that is in the affected Member, or likewiſe even the putrid and ſooty vapors are communicated to the heart, and kindle up the heat in it, and ſo the fewel of the Feaver is in another affected part: it eaſily from hence appeareth, that the Feaver which is joyned with the *Arthritis* is not Symptomaticall, but primary. For in the Feaver that accompanieth the *Arthritis*, the Fewel of the Feaver is not in the part affected (that is to ſay, the part that laboreth under the *Arthritis*) but it is in the great Veſſels. Yea and the Feaver either it precedeth the *Arthritis*, or elſe it invadeth together with the invaſion of the *Arthritis*, and doth not in any wiſe follow the ſame. And therefore this Feaver is deſervedly referred unto thoſe continued primary Feavers, which now adaies we cal accompanying Feavers; to wit, thoſe that are not ſolitary, but ſuch as have ſome other Diſeaſe joyned with them, and that depending upon the very ſame cauſe with it; to wit, when by the motion of ſome humor which Nature endeavoreth to thruſt forth

forth unto ſome outward part, or into the habit of the Body, a Feaver is kindled; or at leaſt the matter that is moved unto any part, becometh withall ſo putrid, that it may cauſe and kindle a Feaver. And as it is in the *Eryſipelas*, Pleureſie, ſmal Pocks and Meaſels, and the like Diſeaſes; ſo this cometh likewiſe to paſs in the *Arthritis*; which ſuch a like Feaver is wont oftentimes to precede, and to invade the Party a day before; or at the leaſt, moſt certainly invadeth together with it; although it be oftentimes very ſmal; and therefore it is not ſo much as taken notice of by many ſick Perſons, and eſpecially ſuch as altogether heed and mind nothing but their pain. But now this Feaver is continual; which yet nevertheleſs remitteth ſomwhat in the morning, but about the evening returneth again in its ful heigth; and this happeneth from the return of the Blood unto the inward parts; this being either voluntary, or elſe ſuch as is cauſed by the coldneſs of the ambient Air, very familiar unto all continual Feavers.

But the very Feaver it ſelf according to the nature of the humor (which together with the humor that is the nigheſt cauſe of *Arthritis* is ſomtimes excited) is wont to be augmented day after day. Now that humor which kindleth the Feaver is not contained in the Veins alone, but ſomtimes alſo in the Arteries; and then the ſigns of putridneſs are not ſo evident and apparent in the Urines: yea in the beginnirg the Urines are oftentimes very thin, and like unto cleer Water, wanting a ſetling; which kind of Urines are likewiſe very familiar in other Diſeaſes that proceed from the motion of the ſerous or wheyiſh Blood.

Queſt. 5. *Whether the failing of Mulberries may produce the Gout; or whether the Fruits of the Mulberry Tree may Cure the Gout?*

THe Occaſion of this Queſtion was at firſt given by *Athenæus*, who in the ſecond B. of his *Dipneſophiſt.*. thus writeth: *Pithernus* (as ſaith *Hegeſander*) *hath left it behind him for our information, that in his Age the Mulberry Trees did not bear any fruit for twenty yeers together; and that then the Gout as a common and Epidemical Diſeaſe raged ſo fiercely among the People, that it ſeized upon not only Men, but even Children, Virgins, Eunuchs and Women: and not only ſo, but this Diſeaſe became ſo vehemently outragious among the ſmaller Cattle, that it ſwept away two parts of all their Sheep.* Whereupon ſome thought that this happened by reaſon of the defect of the Mulberries for thoſe twenty whole yeers; and they attributed unto the Mulberry Fruit a Power and virtue of curing and driving away the Gout. And true indeed it is, that Mulberries do looſen the Belly, and that they afford much benefit unto a hot and boyling Stomack: but that they ſhould have in them any power, or peculiar virtue to cure People of their Gout, this neither Reaſon, nor Experience can perſwade us to. Neither can this be proved from hence, that when Mulberries were wanting for twenty yeers, the Gout greatly raged among the common People. For it is more probable, that by reaſon of ſome extraordinary notable faultineſs in the Air (which ſo continued for twenty yeers together, that it every yeer hurt the Mulberry Trees) vitious humors fit to generate the Gout were heaped up. Which may appear even from this, that not only Men and Women, but even the Sheep alſo (which yet never eat of the Mulberry Fruit) were not free from this Diſeaſe.

Queſt. 6. *What the Cauſe of* Arthritis *is?*

VVE have told you indeed that the nigheſt and moſt immediate Cauſe of *Arthritis*, is the ſolution of continuity in thoſe parts that are about the Joynts, proceeding from a humor that hath flown into them, whiles it either diſtendeth thoſe parts, or elſe prickeh and launceth them; or elſe doth both theſe. And yet notwithſtanding as touching this thing, the Phyſitians do not a little differ among themſelves; and as for the nigheſt cauſe exciting the *Arthritis*, ſome of them determine one thing, and ſome another. Which diſagreement among Phyſitians, I conceive hath not been the leaſt Cauſe why the *Arthritis* hath oftentimes been ſo unhappily and unſucceſsfully cured. For when the Cauſe of a Diſeaſe is not ſufficiently agreed upon, it is not poſſible that the Cure ſhould ever be rightly performed.

Whether a bare diſtemper may be the Cauſe of Arthritis?

And firſt of all, there are ſome likewiſe that do indeed reckon up a naked and bare diſtemper among the Cauſes of *Arthritis*, and this is alſo aſſerted by *Coſtæus* (in his third Book upon *Avicen.. Fen. 22. tractate* 2. Chap. 5.) for this reaſon, becauſe that ſomtimes there is a pain felt, without any ſwelling at all, which is wont to be joyned unto a diſtemper with matter. But a bare diſtemper (let it be even what it wil) is not the nigheſt cauſe of this Affect, ſeeing that the diſtemper that ſomtimes excites ſo long a continuing pain, cannot poſſibly

ſubſiſt alone; neither can it likewiſe be the cauſe of ſo great and grievous a pain. And moreover, the very humor it ſelf (oftentimes manifeſt enough) doth ſufficiently ſhew that beſides the diſtemper there is likewiſe preſent an afflux of the humors.

And although in the beginning there is oftentimes no ſwelling at al that appeareth outwardly, yet neither doth this ſufficiently evince that there is therefore no humor within. Like as in the Pleuriſie, the Toothach, and the many other pains of other parts, the humor lying hid within diſcovereth it ſelf by pain alone, but by no ſwelling at all. Moreover, purging and ſweating Medicaments are of ſingular uſe in the curing and prevention of this Diſeaſe; which yet are no waies neceſſary in a pure diſtemper.

And although that *Paræus* relateth a Hiſtory of his own Diſeaſe, by which he would prove that a naked and bare diſtemper may produce the *Arthritis*; yet this ſtory of his doth not ſufficiently prove that there was no afflux at al of the humors preſent; ſince that the qualities of the external Air may excite an afflux of the humors. *Petrus Salius Diverſus* indeed (in his Tract of the affect. of the parts) maketh mention of an *Iſchias* or *Arthritis* from drineſs; the cauſe whereof was neither known to *Galen*, nor yet unto any of thoſe that came after him: but *Hippocrates* only knew it, as appeareth in his B. of the internal Affections. But (as he writeth) we are not by drineſs to underſtand any dry diſtemper of the parts conſtituting the joynt it ſelf (to wit, of the bones, ligaments, and tendons) but a waſting and conſumption of its glutinous humidity, by which it is naturally nouriſhed, and whereby the joynt it ſelf is oyled as it were, and made the more fit for motion. For if upon any occaſion whatſoever it ſo happen that this humidity be wholly dried up, there the motion of the joynt is hindered; and a difficulty of the motion, and withal a pain ſucceedeth. And he tels us, that this Affect, if it be in the joynt of the Hip, it is then by *Hippocrates* called the *Iſchiadick* or *Sciatick* pain; but that he himſelf had likewiſe taken notice that it might be bred in any other joynt whatſoever.

But *Galen* was not ignorant of this Affect; only he denieth it to be the true *Arthritis*; and he tels us that it was only a certain kind of Impediment in the motion, whilſt that in the third Section, and 16. Aphoriſm, he thus expreſsly writeth: If immoderate drineſs conſume the humidity of the joynts, it then indeed cauſeth a certain difficult motion by reaſon of the drineſs; and perhaps likewiſe now and then a pain. But that this paſſion (which they cal *Arthritis*) is in no wiſe cauſed, unleſs any one be diſpoſed to cal al the pains whatſoever of the joynts by the name of *Arthritis*. And moreover (I ſpeak it without detracting in the leaſt from the worth of men ſo eminent) be it ſo indeed, that ſuch a pain and impediment of the motion may proceed from drineſs: yet I much doubt of this, Whether or no this pain be cauſed only by the waſting of that humidity whereby the heads of the bones are as it were anointed and oyled. For in the whol ſpace in the which they are joyned together, the bones are not covered with any *Perioſtium*, and thereupon they are wholly void of ſenſe; and therefore in this place pain cannot be excited. But it ſeemeth to be more agreeable to truth (if there be any impediment of the motion, or any pain excited in the joynts by reaſon of drineſs) that this happeneth by reaſon of the over drying of the Tendons, the extremities of the Muſcles and Ligaments; by means of which the Members are rendered unfit for motion: and if it be ſo that they ought to be moved, there is a neceſſity of their being violently extended; and this violent ſtretching forth breedeth a pain.

Whether a windineſs may cauſe the Arthritis?

Seeing therefore that a naked and bare diſtemper cannot cauſe the *Arthritis*, it remaineth that we make enquiry from what matter it may be excited. There are ſome indeed (as *Guainerius*, and *Matthæus*) that make mention of windineſs, and of the degrees thereof. But a windineſs cannot poſſibly excite ſo great a pain, and oftentimes alſo of long continuance in theſe parts; unleſs by windineſs any one be minded to underſtand the ſpirit; touching which we ſhall ſpeak more hereafter. And although the pain be oftentimes movable, and flitting from place to place; yet this is not from any windineſs, but from the humor, which is alſo moſt apt and fit for motion.

Nakir *what kind of Affect it is.*

There are ſome likewiſe that unto *Arthritis* refer that Affect which by the Arabians is called *Nakir*; which *Albucaſis* (in his ſecond B. and 93. Chap.) thus deſcribeth: *There is* (ſaith he) *in this Country of ours a certain ſickneſs or Diſeaſe which they call* Nakir; *and it is a pain that happeneth in ſome certain Members, and afterwards is changed from one Member to another: and of this diſeaſe I once ſaw ſuch an Example as this that I ſhal now relate. I was upon a time called unto a certain woman being ſick and weak in a Village not far from me. She uncovered her Arm, where I beheld a ſmal Inflation in the Vein of the Arm; and about an hour after I ſaw this Inflation to proceed forward with great ſpeed (like as a worm creepeth) and aſcending upwards unto the Shoulder much ſooner than could*

could possibly be imagined; and it was moved upwards like as Quick-silver is moved when it runs from place to place. The pain therefore departed out of the place where it was at first, and fixeth it self in the Shoulder. And afterwards, as she her self told me, it rowled up and down throughout the whole Body; even as I my self might very easily discover it to be so. I therefore greatly admired the swiftness of its motion from Member to Member; for indeed I had never until now seen any such kind of Disease as I saw in this Woman. Indeed I have seen many that have felt the pain changing and going from one member to another, but not after this manner, or with this celerity; neither could I here conjecture any other cause then this to wit, that the Woman was quite spent, and dispirited by the heat of the Sun, and her hard labor and pains-taking, (such as they are wont to undergo that live in villages) her Body being very dry, and her Veins uncovered. And hereupon therefore that windiness appeareth to be changed even sensibly; and of necessity it is that it cannot appear after this manner in such as live idle and delicated lives, and in moist Bodies, and where the Veins are kept covered. And therefore whensoever thou attempteſt the curing hereof, and the Patient Feel that pain, then if it be the same, it appeareth to the Eyes, as we said before. Then hasten and bind both upon it, and under it; and cut upon it, till the Windiness that is pent up and kept in hath a vent and passage made for it to go forth; and Cauterize the place. But if it be so that thou canst not see the place that is affected, and the pain, then Cure it with the excussion of the Body, and some kind of Remedy that expelleth windinesses, and extenuateth them. And for this purpose, very necessary and useful are the Fœtid *Pills, the Pills* de Sagapeno, *and the like.* Thus far *Albucasis.*

But this Disease is not *Arthritis.* For neither is it only about the Joynts, but it ariseth from a Windiness, or furious spirit poured forth out of the Vessels, and running to and fro throughout all the external parts of the Body. There are some who think that this motion of windinesses, and spirits, is made in the Veins themselves. And true indeed it is, that oftentimes in the Vessels and Bowels such like windinesses do run up and down with great violence and rushing; like as *Antonius Benivenius* (in his Tract of *hidden Diseases*, and *the Cure of the Causes, Chap.* 81.) Relateth that *Ludovicus Nicolinus* was so affected with a winde rushing violently into his Bowels and Stomack, that not only his Bowels and Breast, but his shoulder-blades were likewise extended with an incredible pain; and he was likewise sorely troubled with a great and miserable streightness of breathing; whereupon also he died the third day. But in that History of *Albucasis,* it is probable, that the Flatulent and windy spirit that he speaketh of was poured forth of the Vessels into the very superficies and out side of the Body. For seeing that the motion there spoken of was joyned with a great pain, that spirit could not be contained only in the Vessels, as being such that are destitute and void of all sense.

And some there are who think (and this rightly enough) that this Affect, (if it be not one and the same, yet that it) is very neer of kin unto that described by *Wierus,* in a peculiar Tract, (in a Book he wrote in the *German Tongue,* touching *unknown Diseases*:) of which likewise *Henricus a Brar,* wrote an Epistle to *Petrus Forestus*; which Epistle is annexed unto the *observations* of *Forestus,* in his *twentyeth B.* of *Observations.* Those of our times do for the most part refer them to inchantment; and they tel us I know not what of Elves and Fayries that (as they conceive) breed those pains; when yet notwithstanding these and such like of flitting pains that run up and down in the Body may also have their Natural Causes, and they may have their Original from a certain sharp Flatulency, or a sharp whey bred out of a Humor almost Scorbutick, and roving up and down the Body by the Membranous parts and Muscles. And from hence it is also apparent, that they cannot be fitly referred neither unto the *Dracunculi* of the Ancients; in regard that there is here no worm that lieth underneath. The *Westphalians* for the Cure hereof use (as a peculiar Remedy) Earth-worms; of which see *Wierus,* in the *place alleadged.*

But we shall add no more touching this affect, in regard that it doth not properly appertain unto *Arthritis,* of which we are now treating. And yet by the way I think it not fit to pass over in silence what I find mentioned in the Histories of those that were troubled with the *Arthritis,* (which *Forestus* bringeth in his 29. *B.* and so likewise in his 14. *Observation*) where we find mention made of one *Hugo Cornelius,* twenty eight years of Age, who over wearied and tired out in the imployments of his

his Husbandry, and very sleepy as he was, laid himself down upon the Ground, and there he slept for some certain hours; at length awaking, in his left hand, about the wrist, he felt an intollerable pain, which at length seized his whole Arm, insomuch that he was not able to move his Hand, or so much as to stir his fingers, which were now grown stiff as it were: and soon after he was troubled with the same pain about the Foot, unto which was added likewise a very strong and violent Feaver. Of all which notwithstanding by purging and altering Medicaments, and by the administring of Topicks, he was cured in seven daies times, or less. Where he likewise maketh mention of another, who very drunk as he was lying all night in his Garden upon the cold ground, when he awoke was immediatly taken with a violent feaver, and most intollerable pains, of which in a very short time he died. But as it seems to me, those affects were not properly Arthritick, but rather acute feavers contracted from Vapours exhaling out of the Earth, which they both of them received by sleeping thereon; in which feavers Nature thrust forth part of the vitious Humor unto the extream parts of the Body; and so from this Humor there were not only pains excited in the Joynts, but also in the whole Arm, the Membranes of the Muscles being there affected: and so great was the pravity of this Humor, that it likewise snatcht away one of these two by a sudden Death.

Whether a Humor, and what kind of humor it is and whether al the four Humors may be the cause of Arthritis.

Seeing therefore that neither a naked and bare distemper, neither yet a windiness alone can be the cause of *Arthritis*, most Physitians indeed therefore agree in this, that it is some Humor that causeth the *Arthritis*: but what kind of Humor this is, herein they greatly differ. Some of them think that all the four Humors (to wit, Blood, Choler, Flegm, and Melancholly) may be the cause of *Arthritis*: and this they endeavour to make good more especially from hence, that in *Arthritis* there appear many different colors of the swellings, divers kinds of pains, and various accidents; the term of the declination not one and the same, and a much different way and Method to be observed in the Cure, according to the variety of the Causes. To wit, (that I may use the very words of *Petrus Salius Diversus*, in his Treatise of the *Parts affected*, *Chap.* 16.) in some the Colour is much inclining to be red, in others yellow, and in a third sort, white. The swelling is now and then of a considerable bigness, and somtimes again it scarcely appeareth. And as for the pain, it is somtimes indeed very troublesom, but yet not so but that it may well be born; but then at other times (according to the Humor, the cause thereof) it is most sharp and intollerable. And then again, this pain is somtimes soon gone and vanished, but that continueth a long while. But oftentimes also divers evil Symptoms do follow, as an extraordinary great heat and burning in the place affected. But somtimes again, either there is present no heat at all, or on the contrary, there is a coldness that greatly troubleth the party; some of these persons being offended by the Air when it is over hot, and others by an Air too cool. The way and course of Curing is somtimes also very various, because in some of these such Medicaments as heat are found to be most beneficial, and in others those benefit most that cool; the pains in those being the more enraged by things that are cold; but in these they are heightened by such things as are hot. And then again, some of these pains are appeased by the Evacuation of the Blood, some by the purging forth of Flegm, a third sort from the emptying forth of the Choler, and the last kind of them by the Evacuation of Melancholly are very much mitigated and allaied. All which seemeth to denote thus much unto us, that the cause of the *Arthritis* is somtimes hot, and now and then cold and somtimes, the matter thereof very various and different.

But these Reasons do not sufficiently prove that which they ought. For although that (according to the various treasuring up of Humors) divers kinds of Humors may flow unto the part affected; yet these are not the prime and principal cause of the *Arthritis*, but together with the *Serum*, or Whey, they are forcibly carryed unto the part affected; or else they are drawn thither by the pain. And that that Humor which breedeth the swelling is not the principal Cause of *Arthritis*, appeareth even from hence, that in the beginning before the part swelleth, the pain is most intense, and violent, but as the part by degrees swelleth up, so the pain more and more remitteth. Neither indeed is this opinion agreeable to the truth. For many there are who although they be troubled with a Plethory and Cacochymy, yet notwith-

withſtanding they are not at all taken and ſeized upon by the *Arthritis*. And in ſpecial, (as for what concerneth the Blood) it doth not at any time any manner of way generate the *Arthritis* by its abundance. For the blood is the Treaſury of Nature; and therefore although it doth abound, yet nevertheleſs Nature doth not eaſily and upon all occaſions expel it unto any part whatſoever, but more eſpecially thoſe parts that are void of blood, ſuch as they are that are affected in the *Arthritis*. And then again, if the blood ſhould alſo happen to be driven forth thither, ſeeing that it is milde and harmleſs, it could not poſſibly ſtir up ſo great and vehement pains; which yet are alwaies preſent even in the beginning of the *Arthritis*, before ſuch time as the part begin to ſwel, and grow red. And if the *Arthritis* were from the blood, why ſhould not the Tumor then be ſuppurated; ſince that there is no Humor ſo eaſily brought to a ſuppuration, and converted into *Pus*, as is the Blood?

whether the blood may cauſe the Arthritis.

And as for Melancholly, the Caſe is likewiſe very plain; and there are but few that will have this Humor to be the cauſe of *Arthritis*: for it being a very thick and dull Humor, it cannot eaſily inſinuate it ſelf into thoſe moſt ſtreight and narrow paſſages.

whether Melancholly may be the cauſe of Arthritis.

But as for Choler, there are ſome who upon very good ground will have the *Arthritis* to proceed from it alſo, and not only from the flegm; and this they endeavor to prove even by thoſe very ſigns that appear in the *Arthritis*. For the pain is for the moſt part extream ſharp and violent; and not unlike unto that pain that is pricking and ſhooting; and the Diet that went before was dry and hot; or at leaſt, very much tending thereunto: the excerciſes alſo were over-violent; and the habit of the Body thin and ſpare. And the very truth is, that this is not indeed to be denied, that thoſe things do ſomtimes befal the ſick perſons; and that oftentimes alſo the pain is ſo ſharp, that it cannot poſſibly by any meanes be referred unto that Crude Humor Flegm, but argueth rather a hot Humor. But now a Queſtion may be here made, whether or no every preternatural hot Humor may be called Choler; and we think that we may well deny this to be a truth: and we determine with *Carolus Piſo*, that there may be a Serous or Wheyiſh Cacochymy, (although he doth not rightly explain it) and that there may likewiſe be a Serous Humor that may be moſt hot; and that under it there may alſo be comprehended thoſe ſharp *Ichores*, (of which we find *Hippocrates* and *Galen* making mention, and of which we ſhal have occaſion to ſpeak more anon) or if you had rather ſpeak as do the Chymiſts, that Tartarous Salt, or the ſpirits of Tartarous Salts. Neither are all that are troubled with the *Arthritis* of a thin and lean, or ſlender conſtitution of Body, and a Cholerick Conſtitution and temperament.

Fernelius (in his 6. *B. of the Diſeaſes of the parts*, and the *Symptoms*, *Chap.* 19.) rejecteth all the other Humors; and he there determineth, that not blood, nor Choler, nor Melancholly, but only the cold pituitous or Flegmatick, and Serous Humor, may be the Cauſe of the *Arthritis*; and that every *Arthritis* is cold, and proceedeth from a cold Humor. And in this indeed his Opinion is right and agreeable to the truth, that of one Diſeaſe there is but one only cauſe; but in this he is very much miſtaken, when he tels us that this Humor is cold; ſince that almoſt all the Symptoms that befal Arthritick perſons teach us the Contrary; to wit, that moſt acute and ſharp pain, burning heat, ſudden motion, and the reſt of them. For although when this Humor firſt beginneth to be moved there may ariſe ſome kind of coldneſs, by which the whole Body may be extreamly Chilled, and made to ſhake; yet notwithſtanding this is no ſure and certain ſign of a cold matter; ſince that even the hot Humors alſo (when they are moved through thoſe parts that have their ſenſe and feeling) may by little and little produce a coldneſs, or chilneſs, and horrour; as it is alſo very manifeſtly to be ſeen in Cholerick Feavers. And then Secondly, he erreth likewiſe in this, that he accounteth flegm and the Serous Humor for all one Humor; as likewiſe in this, that he will have the Serous Humor to be ſimply a cold Humor. For albeit that in the Serous Humors there are many parts that are wateriſh; yet there are alſo many parts therein that are ſharp and Salt, by which it differeth from ſimple and pure Water.

whether or no, Flegm according to Fernelius may be the Cauſe.

But *Fernelius* ſeemeth to have taken this his Opinion from *Galen*, (in his *tenth Book of the Compoſit. of Medicaments according to the place*, and 2 *Chap.*) where he writeth, that the Humor which exciteth the *Arthritis* is ſomtimes indeed the Blood;

blood, but for the greatest part a Flegmatick Humor, or mixt Humor, partly Flegmatick and partly Cholerick, or likewise of the blood mingled together with those aforesaid. Or if any one would speak more exactly as concerning it, he may say that it is not a flegmatick humor, but that the Humor which most an end is called Crude and undigested, and is for the most part predominant about the Joynts, is now and then very thick, and like unto the thicker sort of *Pus*: but when it hath for a while continued in the joynts, it is then rendered not only more thick, but also viscid and clammy.

There are very many other Physitians that in this follow the Opinion of *Galen* and *Fernelius*; and they account the Flegmatick, Cold, Crude, and Serous Humor, for one and the same; and withal they teach us that it is the cause of *Arthritis*. But in this they are al of them mistaken; seeing that neither can so sharp a pain proceed from such a cold and crude humor; and because that the *Arthritis* invadeth the sick person suddenly; and then oftentimes lieth hid again for a while, and is removed into another place; for the doing of which the thick and dul flegmatick humor, and that humor likewise that so neerly resembleth thick *Pus*, is altogether unfit. And moreover, seeing that even in the very beginning (when there is no swelling as yet appearing) the pain is most vehement and exquisite, this is sufficient to shew that it is caused by a humor both subtil and sharp (and this also penetrating into the most streight and narrow passages, and pricking the Membranes) and that it proceedeth not from any thick and cold humor. Neither do those *Tophi* that are generated in Arthritick persons sufficiently evince that Flegm is the cause of *Arthritis*, because that those *Tophi* or hard knots before spoken of do rather proceed from a humor that is Tartarous and neerly allied unto Earthy Minerals, than from a crude and raw flegm. *Thomas Erastus* indeed (in his fourth Disputat. against *Paracelsus*) writeth that he never but once saw the Gout bred from a pure and meer flegm; and this was in a certain noble person of *Helmstadt*, who was sick without any pain at al, if he kept but his hands and feet quiet: there was no redness to be seen; but a white swelling loose enough; although that his joynts were not without hard knots, but had many of them, and that for many yeers before he had not been able to stand upon his feet. But that Affect at this time was not indeed the Gout truly and properly so called, but only an *Oedematous* tumor, with the which the feet (by reason of a long and lasting afflux of the humors) were much troubled. But now that in the very beginning the blood with the flegm (or rather indeed a serous humor) flowed down into the Feet, and corrupted them, this is confessed even by *Erastus* himself.

Whether or no the serous filth be the cause of Arthritis, according to Piso?

Carolus Piso (in his B. of Diseases from a Wheyish filthiness, in two of his *Consilia* touching *Arthritis*) will have the serous and wheyish uncleanness to be the one only cause of *Arthritis*. Which Opinion (if it be rightly explained) is absolutely true and undeniable. But in this he is deceived, that he thinketh this *Serum* or Whey to be a pure Water; since that we are taught far otherwise by the symptoms, and those things that befal Arthritick persons.

Whether flegm mingled with choler, according to Mercurialis?

But others there are and (among the rest *Mercurialis*) who both knowing and acknowleding that such vehement and grievous pains cannot possibly be excited from a flegmatick and crude humor (in regard that it is certain that those most vehement and wracking pains are from a hot cause) and that likewise the flegmatick and crude humor is altogether unfit for so quick and sudden a motion as we see to be in the *Arthritis*; and that it cannot possibly insinuate it self into those Membranous parts; they therefore take the latter of the two Opinions in the place alleadged out of *Galen*, and determine that the *Arthritis* hath its original from Flegm mingled with Choler; and that the Choler is mingled together with the thick and tough flegm, being unto it as a Vehicle, or Conduit-pipe, for conveyance. But yet neither doth this Opinion satisfie us, unless that mixture of Flegm and Choler be understood of the serous or wheyish humor. For seeing that they themselves do acknowledg that so fierce and cruel a pain doth require a hot cause, this cannot therefore be from Choler mingled with Flegm, since that flegm doth dull and blunt the acrimony of Choler, rather than increase it.

Whether crudity according to Mercatus *may be the cause?*

Ludovicus Mercatus whilest he acknowledgeth, that the vitious humors (although they abound in the Body) do not presently generate *Arthritis*, but even other Diseases; therefore he betaketh himself unto a Crudity also; and thereupon determineth that the vitious humors ought to be Crude and undigested, before they can generate the *Arthritis*. But then when he would again acknowledg, that a Crudity is not simply enough and sufficient for the generating of *Arthritis*, he feigneth and inventeth divers things as touching Crudity; and determineth that that Crudity alone is fit for the generating of *Arthritis*; which proceedeth

proceedeth from the rarity and thinneſs of the heat (now whether or no he here ſpeak properly I leave it unto any mans Judgment) and that it is done three manner of wayes: Firſt of all, when the fatter part thereof is ſeparated and drawn out from it. Secondly, by reaſon of its diſſolution from an Exterual heat. Thirdly, becauſe that it hath mingled with it ſomwhat that is unconcocted, but hot. And yet notwithſtanding at the length he concludeth, that this Crudity of the humors is not any ordinary kind of humor, ſuch as the reſt are that procreate and beget Feavers, Defluxions, and many other Diſeaſes; but that it is a Crudity which obtaineth ſomthing that is peculiar and proper unto it, by reaſon of which it more inclineth unto, and ſooner cauſeth this Affect than any other: and this (as he tels us) is then done when the humors are made more thin by their being poured all abroad, and likewiſe by their mordacity and corroding quality; by which they are eaſily ſeparated from, and rejected by all the other parts, until they come to the Joynts. In this indeed he rightly and moſt truly aſſerteth, that that humor hath ſomwhat in it that is peculiar, by which it generateth the *Arthritis* and no other Diſeaſes. But now, if we well and exactly weigh and conſider this Crudity, or rather the Condition of the humor (as he calleth it; but yet every humor that is preternatural may not rightly be called Crude) moſt certainly agreeth with the ſerous, ſalt, and tartarous humor before mentioned and deſcribed by us; as ſuch which is thin, biting, poured abroad, or (as the Chymiſts ſpeak) reſolved by the tartarous ſalt. So that *Mercatus* ſeemeth to have underſtood the thing wel enough, but yet was not able wel to expreſs himſelf in words, as concerning it.

whether a humor malignant and of an occult quality may be the cauſe according to Paræus?

Ambroſe Parry (in his 17. *B.* and 2. *Chapter*) whenas he himſelf likewiſe took notice that the humor which generateth the *Arthritis* was a nature altogether different from thoſe that are the Authors of the *Phlegmone*, *Oedema*, *Eryſipelas*, or *Scirrhus*, he for his part determineth, that the nature of this humor was neither better nor worſe, but the very ſame with that from whence the Plague, French Pox, or the Epilepſie have their Original; and this he endeavoreth to prove: 1. Becauſe this humor never cometh to a ſuppuration, as do all the reſt of the humors. 2. Becauſe that it produceth pains far more ſharp and bitter than the other humors; inſomuch that the ſick Perſons often complain that they feel the part affected to burn as they think. 3. Becauſe that it is changed into hard knobs or knots, which doth not happen unto any other of the humors. 4. becauſe that it wil very hardly give place or remove for any Remedies whatſoever; but is rather more ſtird up, exaſperated, and enraged by them; ſo that the Patients are ready to tell us, that it is far better with them when they are without any remedies at all than when they have them applied. 5. Becauſe *Galen* himſelf (in his *B.* of *Theriaca* to *Piſo*, *Chap.* 15.) ſaith that Treacle is very uſeful for all Arthritick Perſons whatſoever, as that (in *Paræus* his Opinion) which dulleth and blunteth the malignity of the humor. In this indeed *Paræus* his Opinion is right, that the common ordinary humors (Choler, Flegm, and Melancholly) do not produce the *Arthritis*, but that the humor which is the Cauſe of the *Arthritis* doth obtain and hath in it ſomwhat that is proper and peculiar, and this is ſufficiently proved by the Reaſons above alleadged by him: but indeed there is no need at all that we ſhould here have recourſe unto any peculiar Malignity, and occult quality; neither do the Reaſons alleadged prove it. For there appeareth here nothing that is Malignant; but the vehemency of the pain proceedeth from the Acrimony of the humor; the which happeneth likewiſe ſomtimes in the pain of the Teeth, Ears, and other parts. And although that *Galen* commend Treacle as good againſt the *Arthritis*; yet this doth not at all argue, nor make that it ſhould ſubdue the Malignity of the humor, but rather that it ſhould conſume the vitious humors; and many other Medicaments of this nature are alſo before propounded, in the Cure of the *Arthritis*. But yet in the mean time we do not deny this, that the humor (which is the cauſe of the *Arthritis*) may ſomtimes likewiſe obtain a peculiar Malignity; like as we ſee it to be in the Scurvy, and the *Polonian Plica*. And yet notwithſtanding we ſay, that it doth not produce the *Arthritis*, as it is a Malignant humor, but as it hath that diſpoſition which other humors alſo (exciting the *Arthritis*) do obtain; that yet are altogether void of any the leaſt Malignity.

whether the Ebullition of Synovia, and a ſalt Spirit, according to the Chymiſts, be Cauſe of Arthritis?

And laſtly, (that we may likewiſe a little conſult the Chymiſts) we do indeed very much expect and hope for ſome light to be given us by them, for the clearing up of the point now in controverſie. But we ſhal hardly get any the leaſt light or ſatisfaction from *Paracelſus* and his followers, who for the moſt part even obſcure the plaineſt truth. For *Paracelſus* (as he is wont) ſpeaketh very variouſly touching the thing in queſtion: For in his Tract touching the *Podagra Gout*, pag. 540.) he there ſaith that the Gout is a diſeaſe, the ſeat whereof is *Synovia*; which when it is exalted, the Gout is then excited: And that the diſeaſe

disease is a Mineral liquor, or a sowr juyce, such as are, Allum, Vitriol, Vinegar, Barberries, Acacia, and the like; for seeing that these Salts are contrary and opposite unto the *Synovia*, if they be generated in any man, and mingled together with the *Synovia*, they then cause the *Synovia* to boyl over: and then he afterwards tels us strange and wonderful things touching the influence of Heaven (which here I scarcely think worth the relating) as likewise those things which he hath in his 2. B. of the Gout. In his *Paramirum* he referreth this Disease to Mercury precipitate: But in his B. of Tartarous Diseases, Chap. 19. he referreth it unto Tartar. *Petrus Severinus* (in his *Idea Medica, cap.* 12.) teacheth us, that the excited Roots of these Podagrick Affects, if they have their seat in the blood, they boyl up with heat, and send spiritual and vaporous Tinctures unto the Domestick places; and that the Matrixes of the Roots having there rotten fruit, do by a dolorous calamity of the Symptoms absolve the revolutions of the Predestinations. But the truth is, the differences of the pain (that I may in plain and easie terms shew you what he by an affected pomp of words obscureth) do all of them proceed from a diversity of the Salts, of which some are more, and some less sharp and biting: but that these spiritual and vaporous Tinctures are received by their Matrixes, (that is, those parts that are obnoxious unto the drawings out of the Podagrick fruits, when they are resolved; and they have in the general an affinity with them, and therefore readily admit of, and give entertainment to the guest coming unto it) to wit, the joynts, or the *Synovia* of the Hands and Feet.

But here they do by their words obscure a thing that is in it self most plain, and they likewise mingle falsities with truths. For as for what they bring touching the Ebullition of the *Synovia*, and the fervent boyling heat thereof, this *Synovia* of *Paracelsus* is a meer fiction and invention of his own; touching which we have already spoken in our Tract. *de Consens. & dis. Chymicor. cap.* 15. But as for what they speak of the salt Spirits, this (if it be rightly explained, and wel understood) is very agreeable unto the truth, as we shal shew you by and by. And so likewise we may wel enough bear with them in this, that they endeavor to explain the differences of the pains in Arthritick persons from the differences of the Salts that appear in Vegetables and Minerals; in regard that our own ablest Physitians (and among the rest, that most experienced *Felix Platerus*) are al of Opinion, that the humor which is the cause of *Arthritis* is not simply a Water, but endued with a quality of a different Nature, and mingled together with the *Ichores* and Excrements of the Humors, by which it is rendered more vehement. And so we likewise judg this more fit to be rejected in them (which yet *Severinus* delivereth unto us in words too obscure) to wit, that the other excrementitious humors are moved unto other parts; and that the humor which is the cause of *Arthritis* hath in it a peculiar tendency unto the joynts; as we also shewed you above. And therefore (that we may at length conclude this controversie) it appeareth from what hath been hitherto said, that neither simply the blood, nor flegm, nor melancholly, nor yet a Water, is the neerest and immediate cause of the *Arthritis*. But when I have wel weighed al those things that befal Arthritick persons, and which cannot possibly be derived from the Humors (as is manifest by what hath been hitherto said) I cannot otherwise determine, than that a salt, sharp, subtile humor (and such as for the most part resembleth the nature of the fallow spirits, is the nighest cause of *Arthritis*. And now, let who wil cal it Choler, or Flegm mingled with Choler, or Salt, or Tartar, or what he please, he may do it for me, so that the thing be but rightly explained. I for my part shal make use of the word *Serum* or Whey, Salt, and Tartar, that so I may likewise by a proper and peculiar word explain a thing that differeth from Choler and the ordinary and common Flegm. But now that the *Serum* or Whey is not only a watery humor, even the Ancients have acknowledged; and *Galen* in the sixth of his *Epidem. Comment* 3. *text.* 33. writeth that the serous or wheyish blood is by *Hippocrates* and *Plato* called not only a Water, and watery humidity void of biting, but biting likewise and corroding; to wit, which resembleth the nature of the Sallow or Willow spirits; and therefore it is that it pricketh and biteth those parts that are so sensible and quick of feeling, and in these it exciteth most acute and intolerable pains. There is, to wit, in the Earth (out of which Plants grow, by which both Man and bruit Creatures are nourished) something that is salt, which answereth unto Minerals; and it may not unfitly be called the salt of the Earth; which yet notwithstanding is scarcely to be found pure and alone, but it is mingled together with other bodies; from whence divers kinds of Earths have their Original; and thereupon (according to the great variety of Soyls) it is very various and different; as Muddy, Clayie, &c. and then at the length in Plants and Animals it is called Tartar; and so it cometh to be transfused into men. But this, albeit that in Plants and Men it become in the many various Concoctions very subtile

The Authors Opinion touching the cause of Arthritis.

tile and volatile (if it be not ſuch before) as very manifeſtly alſo it appeareth from the Salt of Urine, and that at length it is mingled even with the blood it ſelf: yet nevertheleſs in regard that from the very firſt original of it it is altogether unfit for the nouriſhing of the body, and is (as *Hippocrates* ſpeaketh) wholly unſerviceable thereunto, at the length (unleſs it be forthwith, even in the firſt Concoction, expelled forth by the belly or afterwards evacuated forth by ſweats and Urines) it is treaſured up; and being burdenſom to Nature it is thruſt forth unto the Joynts (as having a certain kind of neer allyance with ſuch like matter) where by its acrimony it exciteth moſt vehement and grievous pains. Neither let any be hereat moved, and wonder that we ſay that this matter is one while ſpiritual, and ſomtimes alſo Tartarous, and ſo very fit likewiſe for the generating of thoſe hard knots which they cal *Tophi*. For (that I may ſpeak with the Chymiſts) ſpirits may proceed from bodies, and again bodies may be from ſpirits. This matter in its original, and while it was in the Earth, was a body, and ſomwhat as it were Earthy, and Mineral like: but it cometh afterwards to be attenuated in the various Concoctions both in Plants and Men, and ſo it is made as it were ſpiritual: which hath been acknowledged by many of *Galens* followers; and among the reſt, by *Cardanus*, who upon the 47. and 49. Aphoriſms of the ſixth Section, writeth that the *Matter*, to wit, the cauſe of *Arthritis*, is as it were a ſpirit. And *Lucian* in his *Tragopodagra* calleth it a violent and injurious ſpirit. And yet afterwards this thin humor or ſpirit, when it hath once gotten a fit place (to wit, the bones, and the places about the joynts) it again betaketh it ſelf into the body, and is there coagulated; like as it is a thing generally wel known unto the Chymiſts; and other ſalt ſpirits may again be coagulated, and return into bodies. And yet nevertheleſs if any one ſhal aſſert that there is likewiſe a volatile Salt in the very Earth it ſelf (which the Plants draw unto themſelves) this doth no way thwart or oppoſe this Opinion of ours; but the whol reſult of the buſineſs and Controverſie in hand cometh al unto one and the ſame concluſion.

Queſt. 7. *Where the Humor the cauſe of* Arthritis, *is generated, and by what waies it floweth into the Joynts.*

IN what place the Humor that is the cauſe of the *Arthritis* is bred, and by what waies and paſſages it floweth into the joynts, in this Phyſitians do greatly differ among themſelves: which diſagreement of theirs hath much hindered the Cure, and made it far more difficult than otherwiſe it would have been; and therefore not without cauſe is it that *Fernelius* (in his ſixth B. of the Diſeaſes of the parts, and the Symptoms, Chap. 18.) writeth that from the very ignorance of this thing the pain of the joynts hath hitherto been held and left for incurable, and called the ſhame and diſgrace of the Phyſitians.

We have briefly above given you our Opinion as touching this thing in Controverſie. But becauſe there are many (and thoſe ſome of them of the more able and learned Phyſitians) that are of another Judgment, and differ from me in their Opinion (as in this darkneſs of Mans mind it is generally wont to be even in the greateſt and moſt ſerious Controverſies) I ſhal not think it time miſ-ſpent, nor my pains il beſtowed, in laying before you (with what brevity I can) their ſeveral Opinions; and in the recital of them I ſhal weigh them accordingly.

And firſt I ſhal indeed begin with *Fernelius*; who aſſerteth that they are much miſtaken, who think that the Humor the cauſe of *Arthritis* doth break forth of the more ſecret and inmoſt parts of the body into the Joynts. *For how* (ſaith he) *is it poſſible that any pure and ſincere humor can from the bowels, and the moſt inward ſeats be carried through the Veins; or that that humor which was ſo lately mingled with the blood ſhould now* (*without any mixture thereof*) *by the Orifices of the veins fall pure into the blood; or if there ſhould alſo together with the humor flow forth any of the blood, which being collected and gotten together in the Joynts doth it not excite a Phlegmone? And why likewiſe doth not the crude humor which is carried into the Joynts by any other paſſages than by the Veins cauſe the* Arthritis? *For in the Cachexie, the crude humors that from the bowels fall down into the feet, and cauſe them to ſwell, do not yet excite the Gout in them.* But even *Fernelius* himſelf taketh it for granted, and plainly aſſerteth that the Head is the Fountain and Original of this Malady, from whence (ſaith he) a flegmatick humor (and this very thin) floweth forth into the Joynts. And this humor (as he tels us) is not indeed gathered together in the Brain (as whoſe excrements are either purged forth by the Noſtrils, or elſe by the Palate fall down upon the great rough Artery, and the Lungs, or elſe into the Stomack, and the more inward ſeats) but it is (ſaith he) collected in the external parts of

the Head, and such as are placed without the Skul, and by the top and superficies of the body run along downward under the Skin. For seeing that there are many Veins running forth thither that are derived from the external Jugular Veins, he conceiveth that they may there lay up their thin and serous excrements; and that in regard the Skin of the Head is thick and impenetrable (so that the humors cannot easily expire and breath through the same) that therefore in progress of time they are there stored up, and from thence by the superficies and outside of the body fall down into the joynts.

There are very many other Physitians that follow this Opinion of *Fernelius*; of the which some of them wil have the humor (the Cause of *Arthritis*) to be collected in the Head alone, betwixt the Skul and the Skin of the Head; and they tel us that is the one only place from whence the matter floweth down unto the Joynts: but there are others of them, who although they likewise add other waies, yet notwithstanding they do withall joyn this way of *Fernelius*: and there are very few or none of them, who do not believe but that this matter doth withall flow down likewise from this place of the Head.

But in very truth, what *Fernelius* complaineth of touching the other Opinion (that by reason of it it so came to pass that the Arthritis was almost left as a desperate and incurable Disease, and was termed the *Opprobium* or disgrace of Physitians) I conceive (without disparagement unto any mans Judgment) that it may more truly be affirmed of this his own Opinion; and I am of Opinion that that Physitian who seeketh for the Spring and Fountain of this Malady in the Head only (neglecting in the mean time the true Fountain and fourse thereof) is scarcely ever likely to cure the *Arthritis*. For albeit it be indeed true, that certain various flitting and wandring pains may be here and there excited by the serous humor falling down from the extenal part of the Head under the Skin, by the outside and superficies of the Body; yet notwithstanding the *Arthritis* is never from hence generated; neither is that matter wont to subsist about the Joynts, but for the most part about the membranes of the Joynts. But now the generating of the humor that is the Cause of the *Arthritis* is very different, and of a far other nature. For this is generated in the sanguification, by reason of the Errors in Diet, and the weakness of the Bowels: and somtimes likewise it is supplyed from the suppression of the Courses in Women, and the sudden stoppage of the Hemorrhoids in both Sexes; and then it is heaped up in the Veins and Arteries: whereupon also so soon as ever it beginneth to be moved, and to become as it were boyling hot, there is almost alwaies a Feaver joyned with the *Arthritis*: yea and somtimes the Feavers are terminated in the said *Arthritis*; and hence it likewise cometh to pass, that in the *Arthritis* the Urine giveth forth most sure and manifest signs and Tokens of the humor that is peccant in the Veins. And hence it is that *Galen* himself teacheth us (in the third Section, Aphorism 20.) that in little swellings and pains of the Joynts, the deeper parts of the Body are throughly purged, the vitious humors being thrust from the more principal parts unto the outside and superficies of the Body: Neither can there any thing else be proved by firm and sonud Reasons. Al which being true as is alleadged, and the case standing thus; and it being most undeniable, that the Humor the cause of the *Arthritis* is contained in the Veins and Arteries, there can no reason be rendered of any necessity (either in Nature, or else in the Disease) why these Humors ought necessarily first of al to ascend up into the Head before they be carried into the Feet; in regard more especially that there is an open and strait way by which themay be moved through the Veins and Arteries, and so carried into the Joynts. And that the matter, the cause of *Arthritis*, is carryed unto the Joynts through the Vessels and not without them, appeareth also even from hence, that the Veins in those joynts that are like to be invaded by the *Arthritis*, swel up and grow big when it first beginneth; and in that the Humor exciting the *Arthritis* (if Repelling Medicaments be unseasonably applied) runneth back again into the Veins and Arteries; and is either transmitted unto the Noble parts, and there exciteth Acute Feavers, anxieties of heart, and other dangerous and deadly Symptoms; or else it is suddenly conveyed into another joynt; whereupon the pain which but ere while infested the Foot, instantly, (if Repellers be unadvisedly administred) thrusteth it self forth and appeareth in the hand; which could not be done, were it not that the Humor were moved through the Vessels. For it is not at all possible that the Humor which but just now was in one of the Toes, should under the Skin be so suddenly carried up into the hand. And if the Humor should in some space of time mount up thither under the Skin, yet it must of necessity cause pain in all those parts through which it passeth, as we may often take notice in those pains that arise from the Serous Wheyish Humor descending without the Skul, that the pain is first of all in the Head, and then afterward it is excited in the Neck, and then in the shoulder

blades,

blades, and the back; and that at the length both the Humor and the pain deſcend even unto the Thighs; which doth not at all happen in the *Arthritis*. And moreover it oftentimes cometh to paſs, that a man by wrath, or fear, is ſuddenly caſt into the *Arthritis*; which happeneth moſt certainly from the Humors being ſuddenly moved in the Veins and Arteries: but if the Head ſhould have theſe Humors ſenſibly and by degrees heaped up in its own Skin, this could no waies happen. And again, if the fountain and original of this Malady were under the skin of the Head, why is not then the Cure chiefly directed to that ſeat, and why are not veſicatories, Cauteries, and iſſues applied unto the Neck; ſeeing that there is ſcarcely a fitter place then this to be found, whereby the matter gathered together betwixt the Skul and the Skin of the Head may be evacuated. And furthermore, if the Original of the Humor were alwaies in the external part of the Head; then of neceſſity there would be preſent likewiſe ſome ſigns thereof heaped up there, and deſcending; which yet in the moſt are not at al taken notice of, their Heads being altogether ſafe and ſound when yet their Joynts are invaded by the *Arthritis*. *Fernelius* indeed among other the ſigns of the Humor heaped up, reckoneth the heavineſs of the Head for one, as alſo overmuch deſire of ſleep, an external pain of the Head, and which is ſtird up only by the touching thereof, (eſpecially if the hairs be kembed back but never ſo little) an Oedematous wateriſh ſwelling, like unto ſoft wax, lying under the Skin, more eſpecially in the hinder part of the Head: but he reckoneth up for ſigns of the Humor flowing downward, a pain running up and down from the Neck, or by the ſhoulders, into the Arm and Hands; or elſe turnd down by little and little along the back into the Hips, Knees, and feet, there ariſing ſomtimes ſome kind of ſenſe and feeling of Cold. But indeed it cannot at all be denied, that theſe ſigns are preſent, when there is a Serous and Wheyiſh Humor heaped up together in the Head, and falling down by the external parts of the Body: but they very ſeldom appear in the *Arthritis*; it being moſt manifeſt by experience, that ſuch as are troubled with the *Arthritis* are yet for the moſt part very wel in their Heads. Neither do ſuch as are taken with the *Arthritis* alwaies perceive that deflux of Humors from the Head, and the pain proceeding therefrom, as but even now we told you. And grant indeed that it be ſo, that in the beginning of the *Arthritis* the head may likewiſe in ſome (where it is but weak) be offended, and that there may be a kind of heavineſs and pain perceived therein, Yet nevertheleſs neither doth this ſufficiently prove that the Humor (the cauſe of the *Arthritis*) is generated in the head, (in regard that the very ſame often happeneth in Feavers, although the cauſe of the Feaver be not generated in the Head) but the head is therefore offended by its conſent with other parts. For when the Humors boyl with heat in the Arteries and Veins, and that they begin to be moved, they partly rove and run up and down by their own impetuous motion (this being proper unto them, when they abound and ſwel up) and partly they are by Nature thruſt forth hither and thither; and then they more eſpecially flez upon the weak parts, until at the length they ſeat and fix themſelves in one certain place. And therefore it is not at all to be wondered at, that in ſuch perſons as have weak Heads, and heads that are otherwiſe very ſubject to excite defluxions, in the firſt invaſion of the *Arthritis* ſome of the Humors (now about to ruſh forth unto the Joynts,) ſhould be poured out by the Capillary Veins under the Skin in the head, and there excite pain, and other Symptoms. Which yet notwithſtanding doth nothing at all patronize this Opinion of *Fernelius*, ſince that even thoſe very Humors are not bred and collected under the Skin of the Head, (as he would have it) but they are ſuddenly poured forth thither by the Veins and Arteries that are ſent unto the head from the external Jugular Veins and Arteries. And grant it indeed to be true, that the Arthritick pains properly ſo called were excited in the Neck, as he ſaith: yet nevertheleſs this is not done by the matter that by degrees is collected under the skin, and by little and little flowerh thither, but becauſe the humors are poured out thither through the Capillary Veins by which thoſe Joynts are nouriſhed. For like as thoſe humors are carried down to the Feet by the deſcending trunk of the great hollow Vein and Artery; ſo the ſame may be ſent upwards unto the head and the parts lying neer about it by the ſame trunk aſcending. And that there appeareth ſome kind of difference of the Symptoms in the ſick perſons, it happeneth from hence, that the humor floweth and is moved, ſomtimes by the trunk of the hollow Vein

and

and Artery aſcending, and ſomtimes by the ſame trunk deſcending (this being more uſual then the other) and now and then by both. For when it is moved upwards by the aſcending, before ever it cometh to the hands by the Axillar branches, ſomthing may eaſily be thruſt forth by the Jugulars (as well the external as the internal) aſcending up into the head, as alſo into the Brain, and under the Skin; where ſome of theſe ſick perſons may be infeſted with reſtleſſneſs and want of ſleep, and others of them with a drowſineſs, and exceſſive propenſion to ſleeping and ſlumbring, and others of them by other Symptoms. But that that Humor which infeſteth the Toes ſhould be collected under the Skin of the Head, or poured forth thither out of the Veins and Arteries, and from thence flow down unto the Foot, this cannot be proved by any firm Reaſon. For what is that right and ſtraight way by the which it may ſuddenly flow ſtraight down from the head, under the Skin, unto the Feet and Toes? For when the matter diſtilleth from the head under the Skin, it is diſperſed hither and thither; and here and there it exciteth pains; but it doth not tend directly and ſtraight downward unto the extream parts of the Feet: neither likewiſe if it ſhould flow down by this way, could it poſſibly (as oftentimes it happeneth) ſo ſuddenly aſcend up into the Hand, by changing its way.

And in ſpecial, as for what concerneth the exceſſive ſleepineſs and drowſineſs we oftentimes find in the ſick perſon, (and if there be any other Symptoms of this kind, that ariſe even in the very brain it ſelf) theſe do neither appear in every *Arthritis*; neither if they ſhould appear, would they at all confirm the Opinion of *Fernelius*, but rather confute it, as teaching us, that the matter is not generated and moved without the Skull, but that it is poured forth of the very Veins themſelves. For this ſleepineſs and drowſineſs is cauſed from the matter that is heaped up within the brain, and not collected without the Skul; which if it be preſent in the *Arthritis*, it teacheth us thus much, to wit, that there is likewiſe ſome matter by the Veins and Arteries poured forth into the brain it ſelf.

And Laſtly, it is manifeſt alſo by experience, that even other Diſeaſes (and eſpecially ſuch as are acute, whoſe matter ſticketh in the Veins, and about the Bowels) are changed and turned into the *Arthritis*; and then the thick Urins are a ſign and argument of the *Arthritis* nigh at hand. And *Averroes* (7. *Collig. Chap.* 3.) teſtifieth that he himſelf became *Arthritick* from an acute Diſeaſe, when Nature by the Criſis had driven forth the Humors unto the Joynts, and eſpecially unto the Feet; which had not been, if the *Arthritis* were generated from a matter flowing down from the Head: touching which we ſhall likewiſe ſpeak more hereafter, when we come to examine the Opinion of *Platerus*.

Neither are thoſe things of any great moment that *Fernelius* bringeth againſt the other Opinion, which we mentioned above, and conceive to be very agreeable to the truth. For when he demandeth, how a ſincere humor can flow unto the Joynts by the orifices of the Veins, he calleth that in queſtion which we may every day ſee done in perſons that are ſick. For Nature reteineth the blood as the treaſury of life; and leſt that it ſhould be defiled and corrupted by the vitious humors, it expelleth them divers waies out of the Veins and Arteries. And certain it is that in the fluxes and Purgations of the belly it thruſteth forth the vitious humors alone out of the *Vena Cava* (or great hollow Vein) unto the Meſaraicks, and from thence unto the Inteſtines: and by Critical ſweats it expelleth the vitious Humors (and theſe indeed ſomtimes ſincere, but moſt commonly ſtinking and of a very ill color) by the orifices of the Veins ending and terminated in the Skin. And the ſame it doth in the Eryſipelas, Scabbineſs, ſmal Pocks and Meaſles, and many other Diſeaſes; in which Nature (that ſo it may preſerve the Body ſafe and ſound) ſeparateth the vitious humors from the good blood, and expelleth them by the Orifices of the Veins. And yet notwithſtanding neither doth that Serous humor alwaies flow ſincere unto the Joynts, but oftentimes it likewiſe carrieth forcibly along with it the blood, and many times alſo other humors. But as for what *Fernelius* addeth, that if the blood ſhould flow forth together with the ſaid humor, it muſt neceſſarily excite a *Phlegmone*, this indeed often happeneth as he himſelf confeſſeth, whileſt as touching the *Chiragra*, or Gout in the hand, he thus writeth: *There is* (ſaith he) *in this affect a beating pain, with a Swelling, Redneſs, Heat, and for the moſt part with ſwoln and ſtrutting Veins.* And touching the *Podagra*, or Gout in the Feet;

there

there is (ſaith he) *a ſwelling preſent here like as in the* Chiragra; *as alſo a Redneſs, Heat, and beating pain both in the part, as alſo in the Veins lying round about it*: al which are ſigns of an Inflammation. Whereupon likewiſe it is that *Hippocrates* (in the ſixth Section of his Aphoriſms, Aphor. 49.) attributeth this name unto the Arthritis, when he ſaith that ſuch as have the Gout are troubled likewiſe with a *Phlegmone*. And yet nevertheleſs every Inflammation is not neceſſarily ſuppurated; and that in the *Arthritis* the humors are not ſuppurated, this ſheweth not unto us the place from whence they flow forth, but rather argueth the Nature of the humor it ſelf, as being altogether unfit for ſuppuration; to wit, ſuch as is ſerous, ſalt, and tartarous; the thinner part whereof is diſcuſſed, but the thicker part thereof that is left behind is converted into hard knobs or knots. For there is nothing ſuppurated but the blood, or that which partaketh of the nature of blood, and hath ſomthing thereof mingled together with it.

Neither yet doth this likewiſe prove that the humor deſcendeth from the head, to wit, that this Diſeaſe doth ſomtimes invade the party with a ſhaking and trembling, or at leaſt with an ordinary and ſlight kind of Chilneſs and Cold. For this quaking and cold is no ſign at al of the humor deſcending from the head under the skin, but rather of the humors being poured forth out of the Veins, like as we ſee the very ſame to happen in feavers, and the *Eryſipelas*.

Others alſo there are (as *Euſtachius Rudius*) who think indeed that this matter floweth down from the head; but then that it doth flow unto the Joynts, not only without the Skul, (between the Skin and the pericranium, by the ſpaces that are under the Skin) but that it deſcendeth within the Scul alſo, by the extream ſuperficies of the ſpinal Marrow: others there are alſo that tell us, how that it floweth down through the very middle of the ſubſtance of the ſpinal Marrow. But if it were thus, as they ſay, there ſhould rather a Palſy or Convulſion be from thence excited; and in the middle ſpace (by the which the humors ſhould flow) the Nerves ſhould likewiſe be affected.

Others there are who Joyn both theſe Opinions together; and theſe tel us that the Humor doth partly flow from the head, and partly are conveyed through the Veins; and this is indeed the moſt common Opinion; which therefore *Platerus* is very large in the explaining thereof; who teacheth us that the Humors exciting the *Arthritick* pains may fal down either within or without the Veins. Within the Veins indeed, when the bloody humor cauſeth the hot *Arthritis*, (as ſome cal it) having the Feaver *Synochus* Joyned with it. For as by a ſubtile and thin blood poured forth into the ſuperficies of the Skin Eryſipelas's (that are accompanyed with the Feaver *Synochus*, or a continual Feaver) are excited; ſo likewiſe while it is poured forth into the ſeats of the Joynts, the pain of the Joynts (which the ſame feaver likewiſe doth accompany) is bred; ſo that indeed who ſoever they be that are Obnoxious unto both theſe Diſeaſes, when they are ſeized upon by the Gout, they may then comfort themſelves with an Opinion and conceit that it is no more then an *Eryſipelas*: All which things are indeed moſt true and certain.

And yet notwithſtanding he determineth likewiſe that the Serous or wheyiſh Excrementitious humors being heaped up together may excite the *Arthritis*; and that their Original is from the head, and that the Source and Spring of defluxions hath there its exiſtence, and that from it they flow down into the parts lying beneath: but that they are there ſomtimes heaped up together in its interior ſeat, betwixt the Skul, and the crude and impure Blood affording matter unto it. For then that part of it that is altogether unuſeful for Nutrition, and Excrementitious, is by ſome and ſome heaped up in the brain, which when afterwards it falleth down it then breedeth the pains aforeſaid; which are accompanyed with a heavineſs of the head, and ſomtimes with a great pain therein, and other accidents, the ſure ſigns and tokens of the matter there heaped up together. And he tels us that the Excrementitious blood is cauſed by the vice and errour either of the firſt, or the ſecond, or even of the third Concoction that is made in the brain; by reaſon, to wit, of ſome diſtemper or weakneſs therein. And withal he telleth us, that al this filth and excrementitious Humors that are heaped up in the head, do either by Reaſon of their too great abundance, when they are ſtirred to and fro, flow downwards, or elſe they are preſſed forth, and poured all abroad by the external cold and the moyſtneſs

of

of the Air; or elſe that they are ſtirred up by the heat of the Sun, of ſome Bath, the Pores and paſſages being opened, and the expulſive faculty provoked.

And yet he determineth likewiſe, that the very ſame ſerous and excrementitious humor may likewiſe be ſtored up without the Skul, betwixt it and the Skin, and that it may from thence flow down into the inferior parts.

But he teacheth us that the waies and paſſages (by which this defluxion is from the Head) are very various. As for the humor collected within the Skul in the Baſis of the Brain (conſiſting of three Cavities ending in the very bottom of the Skul) he tels us that it is ſomtimes ſtrained through by the hole of the Bone they call *Cribroſum* (bearing ſome kind of reſemblance with a Sieve) and diſtilleth out of the Noſtrils, and that it then exciteth that diſtillation we cal *Coryza*, or the Poſe: and that ſomtimes likewiſe it is carried into the middle Cavity, which is full of holes, and looketh toward the Palate; and that then it is either blown forth by the Noſtrils, or brought forth of the Jaws, and ſpit out by ſcreaming and retching; or that deſcending into the ſeat of the Eyes, it exſtilleth forth by tears: and that ſomtimes it followeth the conveyance of the Nerves in the midſt of this ſeat (of which ſome of them paſs through by theſe holes:) and that ſomtimes it being carried into the hinder Cavity of the Skul (which is lower and wider) it deſcendeth through the great hole (in the hinder part of the Head) of the Spinal Marrow, into ſome place of the habit of the Body; and that it ſtoppeth either in the fleſhy parts any where, or about the Region of the Joynts, and there cauſeth the aforeſaid pains of defluxions, or of the Joynts.

But as for the humor collected without the Skull, and flowing downward under the Skin (as it inſinuateth it ſelf either into the Joynts or the fleſhy ſeats) he endeavoreth to produce divers kinds thereof: all which he explaineth at large.

But in very truth, as we willingly admit of thoſe things that he produceth touching the motion of the humors without the Veins (in which he agreeth with *Euſtachius Rudius*) ſo we cannot be induced to believe that the *Arthritis* is generated from thence. For firſt of all, the matter that is generated in the Brain, and exciteth the *Coryza*, or abundance of ſpittle, and is caſt forth by the Noſethrils and the Jaws, it is of a far different nature from that which breedeth the *Arthritis*; and it could not poſſibly otherwiſe be, but that if a matter ſo ſharp and fiery, as it were, ſhould be generated in the Brain, it muſt needs produce moſt grievous ſymptoms. And moreover whether this humor deſcend according to the paſſage of the Nerves, or according to the conveyance of the Spinal Marrow, it could not be, but that it ſhould firſt of all in its paſſage cauſe either a Convulſion or a Palſey, or ſome kind of pain, before ever it could come unto the extream part of the Feet and Toes, and ſhould there excite pain; whereas notwithſtanding on the contrary we oftentimes ſee (and eſpecially in the beginning of this Diſeaſe) that there is ſuddenly a pain excited in the Feet, no pain at all, or ſymptoms elſewhere appearing. And furthermore I likewiſe willingly indeed grant that from the matter heaped up under the Skin of the Head the pains of Defluxions (as *Platerus* rightly calleth them, and diſtinguiſheth them from the Arthritick pains; although he be miſtaken in this that he determineth that theſe pains and Defluctions are only in the fleſhy parts of the Muſcles, whereas indeed they are equally about the Joynts) may be excited in the fleſhy places and Membranes of the Muſcles: but yet I cannot perſwade my ſelf that the *Arthritis* properly ſo called, returning by certain intervals, and having alwaies one time of duration, ſhould thence be generated. For if the humor ſhould fall down betwixt the Fleſh and the Skin, it muſt firſt of all ſeiz upon the parts nigh unto the Head, and upon the Joynts; ſeeing that (as *Galen* expreſly teacheth, in his 2. *B. of the Difference of Feavers, Chap.* 11.) thoſe fluxions that are from the Head are wont in the firſt place to infeſt the parts neer unto the Head, as the Ears, Eyes, Teeth, Gums, and the Glandules that lie next, or the Breaſt and Lungs, and the Muſcles of the Back; whereupon ſuch like pains from a Defluxion preſently in the very firſt beginning of the deſcent of the humor from the Head are perceived in the neck (before and behind) and in the Shoulder blades; but they ſcarcely ever deſcend into the Toes (which indeed are moſt of al infeſted by the *Arthritis*) that ſame thin ſerous humor vaniſhing by the way; which happeneth not in the *Arthritis*, in which the pains are wont firſt of all (and that very ſuddenly) to be excited for the moſt part in the very ends of the Toes. For what *Solenander* writeth concerning a certain noble perſon (as we may find it in the 24. *Conſil.* of his fourth Section) who being troubled with the *Arthritis* about the latter end of the Winter, had (as he ſaith) the humors therefore moved from the Head, becauſe they were not ſuddenly augmented, but encreaſed by little and little, and running from Joynt to Joynt, from Foot to Foot, and from thence into the Knee; and that from hence they aſcended and ſeized upon the Hands, and after this

inſinuated themſelves into the Joynts of the Elbow; this I ſay ſeemeth unto me a thing very improbable. For if the Humor had flown from the Head, it ought firſt of al to have infeſted the Elbows, and then the Hands; firſt the Knees, and then the Feet; whereas here the quite contrary was done. It ſeemeth more agreeable to truth, that this was done from the nature of the humor, and the great abundance thereof. For when it was more thick in the Winter time it is was moved the more ſlowly: but when once there was great ſtore thereof heaped up, Nature firſt of al drives it forth unto the extream parts, which when they could not poſſibly receive all of it, ſhe then afterwards thruſt it forth likewiſe unto the more neer neighboring parts. Neither indeed can I ſee any way, by which this humor heaped up without the Skul, ſhould be carried down ſtraight and directly unto the Feet, and not ramble and rove up and down, hither and thither, like as do thoſe pains from Defluxions. And be it ſo indeed that the Brain doth likewiſe ſomtimes ſuffer certain ſymptoms; and that the pain may firſt of all begin in the nook of the Neck, and may after this ſeiz upon the Shoulder, afterwards upon the Elbow, and laſtly, upon the Hand; yet notwithſtanding that is not at all yet proved which ought to be, to wit, that this humor deſcendeth without the Skul, betwixt the Skin and the Fleſh. For firſt of all how the Gout *Podagra* comes to be bred in the Feet, is not ſhewn in this manner. And moreover, albeit the humor flow within the Veins and Arteries, there may the very ſame ſymptoms be produced in the Brain (which could not at all be if the humor were moved without the Skul, under the Skin) and alſo the ſame pain in the Nook, Shoulder, and Elbow. For while nature is endeavoring to expel that vitious humor by the aſcending Trunk of the great hollow Vein, and Artery, there may very eaſily by the Jugular Veins and Arteries ſomthing flow into the Brain, which may there excite ſome kind of ſymptoms; and before ever it come ſo far as the Hands, it may eaſily happen, that Nature may by thoſe Branches that are diſperſed throughout the Nook and the Shoulders thruſt forth ſomthing into thoſe parts. And whereas all the Joynts in the whol Body, as alſo the parts that lie about them receive their nouriſhment from the Veins and Arteries, there is no Joynt in the whole Body into which likewiſe the humor (the Cauſe of *Arthritis*) may not flow in by the very ſame Veſſels, ſo that there wil be no need at all of ſeeking for blind and hidden waies and paſſages even from the moſt remote parts. And that I may in the laſt place likewiſe grant this, that it may poſſible be, that ſuch like ſerous humors abounding in the Veins may alſo be thruſt forth into the Head, and poured out under the Skin, and upon the approach of the Arthritick Paroxyſm, and Nature ſetting her ſelf upon the work of expulſion, they may likewiſe be moved, and by the Neck may deſcend into the Back: yet notwithſtanding theſe are not thoſe humors that breed *Arthritis*; but deſcending under the Skin, and pulling the Membranes in the outſide of the Body, they excite thoſe roving and flitting pains; yea and ſomtimes alſo they breed a ſpurious and baſtard Pleuriſie; but they are very eaſily taken away by fricions, diſcuſſing Medicaments, and Sweats, the *Arthritis* yet ſtil remaining.

Franciſcus India (a Phiſitian of *Verona*) in his firſt *B. of the Gout, Chap* 4. rendreth this thing very intricate, whiles he writeth that the members that ſend forth theſe ſuperfluities are various and very many, and eſpecially the Head, the Stomack, the Inteſtines, the Liv, and the Kidneys; and that thoſe Fluxions are indeed more eſpecially from the Head, and from the Brain; becauſe that although thoſe humors draw their Original from the Inteſtines, and from the Stomack and other Members, before they flow unto the parts of the Joynts, they firſt of al aſcend into the Head, and from it are afterwards tranſmitted unto the parts lying underneath it. But yet he doth not indeed deny that thoſe humors proceed from the whole Body. For if (ſaith he) the Body were altogether free from ſuperfluities, no humor would at al flow in. And yet nevertheleſs he denieth that the matter doth immediately flow from the whol Body unto the Joynts, ſeeing it cannot poſſibly be, that the humor which is found in the Stomack, or the Inteſtines, or in the Liver, or Spleen, ſhould ſo ſuddenly from theſe parts flow unto the Joynts, unleſs by the incitation of Nature it were driven forth by thoſe waies that lead unto the Joynts. Now he determineth that thoſe waies are the Veins, Muſcles, and Nerves. The Veins, to wit, that are deſtined for the nouriſhing of the Hands and Arms, do carry the excrementitious humors that have their exiſtence throughout the whole Body unto the Ligaments of the Fingers, the Tendons, and the Joynts. But the Muſcles that ariſe from the Shoulder-blades, and the very top of the *Spina* and that are implanted into the Shoulders do receive the ſame excrements from the inferior parts of the Body, and derive them unto the Ligaments of the Fingers. But as for that matter which floweth from the Head, Nature thruſteth it forth unto the Joynts of the Fingers by thoſe Nerves that deſcend from the Head. And yet notwithſtanding afterward he denieth that the humor is carried from

the Head alone unto the inferior parts of the Body; as for Inſtance, unto the Knees, the Thighs, and the Ligaments and Joynts of the Toes; but that by the conſent of the Veins and Nerves of the *Spina* or Back-bone, and by reaſon likewiſe of the conſent betwixt the Kidneys and the Knees, Thighs and Feet, it is ſometimes alſo carried from the ſaid *Spina* of the Back and from the Kidneys unto the Ligaments of the Knees and unto the Joynts of the Toes.

But in this Opinion there are contained many things that are falſe. For firſt of all, whereas it is ſaid that the matter floweth from the whol body unto ſome one place, we are not hereby to underſtand al and every part of the body, the ſtomack, the Inteſtines, the Liver, the Kidneys, and other parts, but only thoſe kind of parts in the whol body that are filled with Veins. For although that the excrementitious humors may be generated in the ſtomack, Inteſtines, Liver, and Spleen: yet when they are heaped up, they are then diſtributed into the great hollow Vein, as alſo into the Arteries, with that perpetual flux and paſſage to and again of the blood; and from hence they are thruſt forth unto the external parts of the body, as in the *Scabies* we may ſee, and ſo likewiſe in very many other Affects. And therefore if vitious humors be heaped up in Arthritick perſons, there is no need at all that they ſhould be derived unto the Joynts by ſo many turnings and windings, by the Muſcles, and by the Nerves; ſeeing that there is a neer and direct way through the Veins and Arteries, from which as al other parts of the body, ſo likewiſe the Joynts receive their nouriſhment. And furthermore it is no way agreeable to truth that the humors ſhould flow unto the Joynts by the Nerves: for neither do the Nerves eaſily admit of, and receive ſo great an abundance of humors; neither were it poſſible, if that matter were received by the Brain, and ſhould flow unto it through the Nerves, but that it ſhould firſt of al excite moſt grievous Maladies, before ever the *Arthritis* could ariſe and appear. *India* indeed ſeeks by al means to avoid al theſe inconveniences, whiles in his ſixt Chapt. he writeth, that the matter which floweth doth not fill the Nerves within; but only diſtend the ſame outwardly. But this is not to flow through the Nerves: neither doth he in this manner ſhun thoſe inconveniences, whiles he doth not ſhew us how by a continual paſſage from the Head (according to the progreſs of the Nerves) this matter may flow, ſo that yet notwithſtanding it may in its way and paſſage excite neither Convulſion nor Palſey, nor any other pain. And indeed to what end is there any need of thoſe ambages, and turnings and windings about (this way and that way) by the Muſcles; when (as we have already often ſaid) there lieth a direct and ſtraight way out of the Veins and Arteries into the Joynts?

Adrian Spigelius (in his B. of the *Arthritis*) hath a peculiar Opinion as being held by him alone: who when he would acknowledg that this afflux is altogether made by the Veins and Arteries, and yet nevertheleſs would not altogether deſert that Opinion which determineth that the humors flow down from the Head, and would withal give us notice, that that flux cannot poſſibly be either without the Skul, or within it, and ſo from the Brain; he therefore determineth, that the fluxion is both from the Head, and from the Liver: but then in this he diſſenteth from all others, that he teacheth us that the aforeſaid fluxion (which he conceiveth to proceed from the Head) is very ſeldom under the Skin (as *Fernelius* tels us it is) and never by the hole of the Spinal Marrow (by which the Spirits are kept together) or by the hole of the Nook, above the external Membrane of the Spinal Marrow; but that by the Veins and Jugular Arteries (not only the external, but likewiſe the internal, by the which from the lower parts, eſpecially the Liver, the humor is carried into the external and internal parts of the Head) it floweth back again into the great hollow Vein, and the great Artery, or its branches that have their exiſtence under the Throat; and that ſo from thence they are devolved into the Joynts.

And the very truth is, that *Spigelius* his Opinion is indeed right, That the flux of humors in the *Arthritis* is by the Veins and Arteries; which he might wel learn even from this, by obſerving that if before the univerſal evacuation of the body there be applied unto the Foot, or the Hand, any external repelling or cooling Medicaments, that then the matter flowed back unto the noble parts, and excited acute Feavers, and other Maladies. But that the matter doth from the Brain firſt of al regurgitate into the Veins and Arteries, this he doth not at al prove, but produceth it without any firm ground and reaſon. For on the contrary rather, thoſe things that happen unto Arthritick perſons do teſtifie that this humor is neither generated in the Brain, nor heaped up there, nor thence regurgitates into the Veins and Arteries; ſince that if this ſhould happen, a humor ſo ſharp as this is, and able to effect ſo great pains, muſt needs excite the moſt grievous Affects in the Brain. *Spigelius* here ſeeks for ſhifts, ſeeing that many things teach us that theſe humors are bred in the Liver and Spleen, the places

and

and ſtore-houſes of Sanguification, and that from thence they are heaped up in the Veins and Arteries, and by them at length thruſt forth into the joynts; ſo that there is no need at al of deriving them from the Brain.

Some there are who determine that the humors are poured forth unto the joynts from the whol body. But theſe by the whol can here underſtand nothing elſe but the Veins and Arteries, diſperſed throughout the whol body.

But that we may at the length conclude this long and tedious diſputation, and contract it into a few words; this in the firſt place is certain, that the matter the cauſe of *Arthritis* is generated in the Bowels of the lower belly; yea, and that oftentimes it is long ſtabled up (as it were) about the Spleen the Inteſtines, and the Liver; until at the laſt it is transferred into the great hollow Vein. And *Mercatus* writeth moſt truly, that as he himſelf had ſeen when the pains of the joynts had ariſen from the pains of the belly; ſo he likewiſe found the ſame to be the Opinion of Authors none of the meaneſt; and I my ſelf have alſo obſerved it more than once in ſuch perſons as were Hypochondriacal, and ſuch as have had the ſcurvy: and from hence likewiſe it is, that *Diarrhæa* fluxes unſeaſonably ſuppreſſed are turned into the *Arthritis*. And that there may flow from the *Colon* Inteſtine a humor exciting the *Arthritis*, we are taught both by *Galen* and *Hippocrates* in 6. *Epidem. Com.* 4. *Text.* 3. And as for the waies and paſſages the thing is very plain (as we likewiſe told you before, touching the Scurvy:) to wit, that from the *Colon* this humor may by the Meſeraick Arteries be transferred into the Trunk of the great Artery, and from hence be thruſt unto the joynts.

And Secondly, This alſo is true and certain, (and that which is granted by all the moſt learned Phyſitians) that the Humor the cauſe of the *Arthritis* is moved through the Veins and Arteries (ſome of theſe ſay alwaies, but others of them very often, and they are thoſe that determine that the humor floweth down likewiſe from the Head) and the thing is altogether ſo plain, that *Thomas Eraſtus* (who notwithſtanding in his 4. *Diſputat.* againſt *Paracelſ.* Page 261. defendeth likewiſe another way from the Head) writeth, that he only can doubt of this thing who doth not ſufficiently attend, and take notice of what is dayly done, or he that hath his minde prepoſſeſſed with a prejudicate Opinion.

And ſeeing that theſe things are true and certain, the doubt now lieth in this, Whether this way be not ſufficient? and whether there may any other be aſſigned? and whether the humors alſo flowing down from the Head, under the Skin, may excite the *Arthritis*, yea or no? And yet notwithſtanding (in the third place) I conceive that this is alſo moſt true and certain, and ſufficiently proved above, that ſomtimes the beginning of the fluxion is not from the Head. For whereas both the part tranſmitting, and the part receiving, do both of them diſcover themſelves by their ſeveral and proper ſymptoms; and that in many Arthritick perſons there appeareth no heavineſs of the head, no pain, neither any other ſymptoms as ſigns and tokens of any humor gathered together and heaped up there; it cannot therefore be concluded that the humor floweth down from the Head. And moreover, neither hath that *Arthritis* which is from the Collick its original from the head, or from the brain, as before we ſhewed you: as likewiſe neither that which proceedeth from a *Diarrhæa* unſeaſonably and unduly ſuppreſſed. And therefore fourthly, this remaineth that may truly be doubted of, to wit, Whether or no the *Arthritis* may ſomtimes have its original from a matter heaped up under the Skin of the Head, and from thence flowing down? Which indeed very many of the moſt learned and able Phyſitians do affirm, whom I leave free unto their own judgments: but yet for my own part I cannot be perſwaded to beleeve it, for the reaſons before alleadged; which here to repeat, I hold it altogether needleſs, in regard eſpecially that I am able very wel to render a reaſon of al thoſe ſymptoms that befal unto Arthritick perſons; although I determine that the humor the cauſe of *Arthritis* is moved only within the Veſſels, and that by them it floweth into the joynts; eſpecially if this be well heeded, that this humor doth ſomtimes moſt chiefly flow through the deſcending Trunk of the hollow Vein, and the great Artery, and ſomtimes likewiſe that it withal floweth by the aſcending Trunk; and that from thence various ſymptoms are excited about the head. What need is there therfore that neglecting thoſe waies which Nature hath ordained as Channels for the motion and flux of the humors, we ſhould ſeek for unknown and unheard of waies? And there is one thing that I cannot but at leaſt touch upon; and it is this, That *Eraſtus* indeed (in the place alleadged) hath this for a ſure and certain ſign of the humor its flowing from the head, that the ſick perſons do for the moſt part manifeſtly feel and perceive the humor to flow down from the head, by the neck, ſides, and back, like unto a wa-

with a kind of ſhaking, trembling, or a ſlight kind of cold. But this ſign ſeems not unto me any whit firm: for that ſhivering and quaking happeneth not only in the *Arthritis*, but oftentimes likewiſe in Feavers, the *Eryſipelas*, ſmal Pox, and Meazels; and it is a ſign and token that theſe Diſeaſes are very nigh at hand; when from the Trunk of the hollow Vein and Artery (eſpecially in the back) by the branches that ariſe from them, and the extremities of the Veins and Arteries, a vapor from the vitious humor, or likewiſe the thinner part thereof is thruſt forth into the parts of the back. For although that without doubt alſo the very ſame happeneth even in other parts, yet nevertheleſs this Chilneſs and trembling is firſt of al excited in the back, by reaſon of the Spinal Marrow, and the very many Nerves there proceeding from the ſaid Spinal Marrow, and being endued with a moſt quick and exquiſite ſenſe; by the which Spinal Marrow a Chilneſs and ſhivering is likewiſe ſeen ſomtimes to aſcend, and ſomtimes to deſcend: touching which ſee more in *Hippocrates* his fifth Section, and 69. Aphoriſm. And thus much may ſuffice as touching this Controverſie.

Queſt. 8. *Whether there may any thing be gathered together in the Joynts that may make any thing unto the producing of the fit.*

NOt only *Paracelſus* and his followers (who derive the *Arthritis* from the ebullition of *Synovia*) have given me occaſion to think of this Queſtion; but likewiſe thoſe ſtrange and admirable Cures that have now and then been made in the *Arthritis* have chiefly put me upon the debate hereof. *Guilhelm. Fabricius* (in his firſt Century, Epiſt. 47. and 48.) relateth that ſome by tortures have been ſo freed from the *Arthritis* that they were never known afterward to undergo any fit thereof. Indeed by affrightment, as alſo by joy, it is a thing very wel known that many have been freed from the Arthritick Paroxyſms. But how a man ſhould in this manner perpetually be freed from the *Arthritis* or joynt-Gout, it is not ſo eaſie a thing to render the reaſon thereof, unleſs it be ſought for in the place affected. And there are likewiſe other Hiſtories of this very thing. That famous and eminent perſon, Dn. D. *Doringius* related unto me, that there was a Citizen of *Gieſſa*, who (through impatience by reaſon of his pain) with a hatchet cut off the great Toes of both his Feet; and ever after this he lived altogether free from the *Arthritis*. *Andreas Libavius* likewiſe (in his 73. Epiſt. to *Schinzerus*) relateth ſuch a ſtory as this. There was (ſaith he) a Patient, an Hoſt, or publick Inholder: A certain Phyſitian (a Chevalier, a perſon of great quality) happening to be there, having agreed with him for three hundred Florens, promiſed the Cure; and when he had received a Writing under his hand for the ſaid Sum he ſets upon it. The Patient is commanded to put his feet upon a Wooden Trunk. There were preſent the ſervants of this Noble Knight (able and ſtrong men) that were commanded to hold him down in a ſitting poſture. The Knight himſelf being provided of an Iron Maller, with ſix Nails faſtened his feet unto this Trunk of Wood; and immediately with all the ſpeed that he could, leaving his Patient crying out in a moſt miſerable manner, taketh his Horſe, and away he rideth. But in the mean time he oftentimes privately maketh enquiry whether the Diſeaſe had ever after returned. And having underſtood (after the ſpace of three yeers) that the Patient had never again been troubled with the aforeſaid Diſeaſe, he returneth back unto the Inn; and there making himſelf merry with his Hoſt, he came fully to know that the Diſeaſe was cured. And thereupon he puls forth the Writing that he had under the Hand and Seal of his Hoſt, and demandeth the Money that was promiſed him, having made it appear that he was the Phyſitian that had wrought the Cure. His Hoſt (although he had been moſt cruelly handled by him) conſenteth to ſatisfie him; and accordingly he fed him and his Followers ſo long, until they had eaten and drunk out the three hundred Florens.

From al which Hiſtories it ſeems that we may collect thus much; That in the place affected there lieth hid ſome kind of Mine, which in its own time maketh much for the exciting of the Paroxyſm. But although it be very hard to determine any thing of a certainty as touching this thing; yet notwithſtanding I wil acquaint you with my own thoughts (at leaſt in the way of a Paradox) unto which I deſire not ſtrictly to engage any man to give his conſent, but ſhal leave every one unto his own Judgment and Opinion.

All

All the parts of the Body, as they are nouriſhed by an Aliment fit and convenient for them; ſo likewiſe in ſick and Crazy Bodies, the Humors that bear a certain Analogy with them are carried up and down unto the other parts; whereupon there happeneth a vitious and corrupt Nutrition. In thoſe that are ſound that which is unuſeful for the nouriſhment of the other parts is (in men) waſted and conſumed in the Nails and Haires; and in Bruites alſo it is converted into the matter of their Hoofs and Horns. In ſuch as are unſound and ſick, the vitious Humors are alſo carried unto the parts appointed for them; which as it happeneth in other Diſeaſes, ſo we may ſee it more eſpecially in the *Plica Polonica*; in which that vitious Humor is not only driven forth unto the haires of the head, which it clammeth and as it were gleweth faſt together, but likewiſe unto the Nails of the Feet, which are thereupon made hard and black. In the Fractures of the bones the ſtone *Oſteocolla*, being taken tendeth unto the bones; and paſſeth into a *Callus*, (and this ſomtimes overgreat) as *Guilhelmus Fabricius* makes it appear unto us by examples, in his *firſt Cent. Obſervat.* 90. and 91.) if therefore Humors fit for the generating of the *Arthritis* be mingled with the blood; it is very probable that they are carryed unto the Joynts, and that with the Aliment of the bones they inſinuate themſelves into the very ſubſtance of them; and that there the Excrement proper unto the bones is collected, as a Mineral and Rudiment of the *Arthritis* that is to follow. And *Galen* ſeemeth to teach us this very manifeſtly, whiles in the 39. *Aphoriſm.* of the 5. *Section*, he telleth us that each part of the Body as it hath its Nutriment, ſo it hath likewiſe its Excrement; and that there is a ſuperfluous Humor left behind, like unto the Nature of the part where it remaineth. And indeed it is a thing very likely and agreeable unto the truth, that there ſhould be ſuch a Tartarous excrement collected, eſpecially in the appendances of the bones, which are more porous then the Reſt of the parts of the bones; and therefore (as *Andreas Laurentius* hath it in his *Second B.* and 4. *Chap.*) they are ſo framed, that they may be as it were the bellies of the Bones, in the which the Aliment of the bones may be concocted, which by degrees may be ſtreyned through into their Caverns. If therefore any ſuch humor, or Excrement, ſhall be collected in the bones, the like humor flowing thereunto, it boyleth as it were with heat; which being done, it is diffuſed into the parts lying neareſt; and there it exciteth a pain in them: and this is eſpecially done in the *Epiphyſes* or additions of the bones, out of which the Ligaments ariſe, and by which the ſenſible parts about the Joynts are knit together. But if the ſaid Humor or Excrement, be diſſipated, or poured out in any other manner, it is credible that the ſick perſon is then altogether freed from the *Arthritis*. Whereupon alſo it is not without good cauſe that ſuch Medicaments as conſume the humors about the Joynts (and wholly dry them up) are here greatly commended. And this might likewiſe have been brought for the confirmation of this Opinion, that ſuch as are Arthritick are prognoſticators of the weather (as they ſpeak) and they perceive in their Feet change of Air, and Alteration in the weather; and as the common people uſe to ſay, they have an Almanack in their Feet. Which indeed *Johannes Anglicus* (in his *Roſa Anglica*) thinketh to happen, becauſe that Air may enter into the Joynts the more freely by Reaſon of their Vacuity and Dilatation. But this Reaſon is of no moment, in regard that the pain is not in the Cavities of the Joynts; and becauſe likewiſe that other parts have greater Cavities, which yet feel no ſuch thing: but without doubt, this pain doth therefore ariſe, becauſe that the neer approaching Changes of the Air do forcibly ſtir up and move the Excrementitious humors ſticking in the Joynts.

And if any one would interpret the Opinion of *Paracelſus* and his followers in the beſt ſence, he may even here have a good ground for his ſo doing. For *Paracelſus*, and *Petrus Severinus*, teach us that the *Arthritis* is generated from the extraordinary heat and Ebullition of the *Synovia*; where if by *Synovia* they underſtand a Humor not Natural, but ſomthing that is Excrementitious collected in the Joynts, they then teach us the very ſame that hath hitherto been ſpoken of. But *Quercetan* in his *Conſil. of the Gout in the Joynts*, and *the Stone*, doth explain the ſame far more cleerly; where he determineth, that the Tartar that is heaped up together, and conteined in the Joynts is the nigheſt and moſt immediate Cauſe of the *Arthritis*; and that it is ſomtimes conteined in the Joynts, and there remaineth idle: but ſo ſoon as there is any new fluxion, (which forcibly moveth it) it then exciteth a Paroxyſm;

roxyſm; no otherwiſe, then as it is when Water is poured upon burning Lime, there is then a certain Ebullition, and heat.

Queſtion, 9. *Whether Boies, Eunuchs, Virgins, and Women may be troubled with the Gout.*

HIppocrates indeed writeth (in the *Sixth Sect.* of his *Aphor. Aph.* 28) *Eunuchs are never troubled with the Gout, neither do they ever become bald.* And in the ſame Sect. *Aphor.* 29. *A Woman* (ſaith he) *is not at all troubled with the Gout, unleſs her monthly Courſes fail her.* And ibid. Aphor. 30. *Boyes are not affected with the Gout, before the uſe of* Venus. But *Galen* in his *Comment* upon the 28. *Aph.* writeth the very truth in this manner. *It was true indeed* (ſaith he) *that in the time of* Hippocrates *Eunuchs were not at all troubled with the Gout; but it is not now found to be a truth, as well in regard of the idleneſs, as the intemperancy of their lives. For in the time of* Hippocrates *there were very few of any condition that were affected with this Diſeaſe, by Reaſon of their temperate lives, and their Extraordinary Moderation. But in this our Age, (wherein there hath been ſo great an augmentation of delights, Luxury, and pleaſures, that there cannot well be any further addition unto them) there is an infinite multitude of ſuch as are troubled with the Gout; ſome never ſo much as exerciſing themſelves, but ill digeſting and concocting their food, and continually diſtempering themſelves with all ſorts of drink, without taking any Meat at all before their drinking of ſtrong wines; and overmuch addicted to venery; and others of them (if they offend not in all and every of theſe particulars, yet) in ſome one or other of theſe exceſſes taking too great a liberty.* And in the 29. Aphor. touching Women, he writeth: *This was formerly a truth* (ſaith he) *that Women (before their monthly Courſes failed them) were not at all ſo much as attempted by the Gout, by Reaſon of thoſe few Errours and exceſſes they were guilty of in the former Age. But now adaies by Reaſon of thoſe many Exorbitancies wherein they offend, there are ſome of theſe Women afflicted with the Gout.* And *Seneca* (in his 95. *Epiſt.*) writeth notably to this purpoſe. *Women* (ſaith he) *taking the like liberty and licence with men, and equalling them therein, have thereby alſo made themſelves equal unto men in their ſufferings, and Diſeaſes of their Bodies. For they come not a whit behind men in their nightwatchings, they drink as much as men; and they even provoke men to exceſs in Oyls and ſtrong Wines; they equal men in caſting up at the mouth whatſoever they had cramb'd into their ſurfetted Bowels; and all the Wine they drink is by vomiting returned back again in ful meaſure: and they equally with men take delight in qualifying the boyling heat of their inflamed Stomacks by melting of Snow in their Mouths; neither come they ſhort of men in their wantonneſs and luſts, as being born to ſuffer. And therefore what wonder is it that the beſt of Phyſitians hath been found in a lie, in regard that there are ſo many Women troubled with the Gout? They have by their vitious lives loſt the benefit of their ſex; and having put off Womanhood, they have condemned themſelves unto mens Diſeaſes.* Thus *Seneca.* Unto which even this alſo may be added, that the Gout which at this day is ſo frequent and common, is from the Grand Parents and Parents derived upon the Children and Nephews of both Sexes. And many ſuch examples there are every where extant, that much derogate from the truth of what *Hippocrates* ſaith in his Aphoriſms. I knew a youth (a Noble mans Son of *Sileſia*) who not many years ſince coming hither to ſtudy, before he was eighteen years of Age, (although I verily believe him to be altogether free from Venery) he was oftentimes afflicted with fits of the Gout. *Antonius Muſa* (upon the 31. *Aphor.* of the *Sixth B.*) writeth that he had ſeen one *Alphonſus Daſſonius* (a Noble youth and one of great note) not above fifteen yeers old, and yet troubled with the Gout; who denied that he had ever excerciſed himſelf in the School of *Venus.* And *Hollerius* (upon the ſame *Aphor.*) writeth that he had ſeen a Boy (not above ten years old) much troubled with the Gout. And *Michael Paſchalius* (in his *firſt B. of the Meth. of Curing Diſeaſes, Chap.* 15.) tels us that he had ſeen a Noble youth (not above ſeven or eight years of Age) troubled not only with the Gout in his Feet, but with the *Arthritis* alſo, or the Gout running up and down in all the Joynts of his Body; and yet notwithſtanding this Diſeaſe in his Joynts was not at all hereditary, his Parents and Grand Parents having never been afflicted therewith. *Antonius Muſa Braſſavolus* (upon the 28. *Aphor.* of the *ſixth B.* of *Hippocrates*) relateth, that he ſaw at *Venice* an Eunuch (almoſt fourty years of Age)

a Turk,

a Turk, who was extreamly tortured with the pains of his Joynts. And the writer of the *Scholia* upon the 63. *Chap.* of the *first B.* of *Hollerius*, (*touching internal Diseases*) tell us that he saw the same. And there is no need at all, neither is it worth while to relate any examples of Women troubled with the Gout, since that they are every where so obvious, and apparent before our Eyes.

Question, 10. *Whether the* Arthritis *be Curable.*

IT is the common and received Opinion of many, that the *Arthritis* is altogether incurable. And the very truth is, there have been many found thus affected, whom the aforesaid Disease hath attended all their life long, and even unto their dying day. Whereupon it likewise happeneth that many of these Arthritick persons (conceiving their Disease to be desperate) will not at al seek unto the Physitian for his advice; and for the same reason also they refuse to abstain from any Errors in Diet. But on the contrary, there are many examples to be found of such as either by the assistance of Physitians, or by a good Diet, or by some sudden and unexpected chance and accident have been freed from the Gout, and have ever after lived altogether free from the same. *Porphyry* (in the life of *Plotinus*) writeth, that *Rogatianus*, a Senatour of Rome, a Platonist, and Scholar of *Plotinus*, by his frugal and sparing Dyet attained so much benefit in this affect, that when as before he was very violently handled and vexed with the Gout, so that he could not so much as go one step forward, but was fain to be carryed in his Chair, he hereby reassumed his strength again; and whereas before he was not able to stretch forth his hands, he by this his frugality and temperance became so wel recovered, that he had now more command of his hands, and could upon all occasions use them more expiditely then such as did their dayly drudgery with them. And so likewise above (out of *Trincavel* his 12. *B.* and 2. *Chap. Touching the manner of curing the affects of all the parts of Mans Body*) we related a story of a certain Physitian (an old man) at *Venice*, who by his abstaining from wine by the space of five years was delivered from the *Arthritis* or Gout during his whole life, even unto the very day of his Death. And we likewise related unto you before (out of *Franciscus Alexander*) of one *Francis Pecchius* (a man much troubled with the Gout) who being cast into prison, and there detained for twenty years, was in the end freed both from his imprisonment and all his Arthritick pains, and so continued free from all fits of the Gout for ever after during his Natural life: And *Marcus Gattinaria* (in *that Chap.* of his *Book*, *touching the Cure of the pains of the Joynts from a hot Cause*) writeth as concerning himself; that when he first began to suffer the fits of the Gout, this was the Course he took for the recovery of his health, and ease from his fits: to wit, first of all, he imposed upon himself an abstinence from Wine for two years, and every month he emptied his Body by Evacuations, and then he took some Pill or other for the diverting of the Humor, (the cause of his distemper) and this he made use of twice in the week; that so Nature might be diverted in her transmitting the matter unto the Joynts, and that so she might rather evacuate it by the way of siege: and by using this course for a while he was so throughly Cured, that he was never after that troubled with any such like pains. And *Carolus Piso* also (*in his Book of Diseases from Serous or Wheyish impurities*, in his *Consil. touching the Arthritis*) writeth, that a certain man who had lived all the time of his youth infested with perpetual pains of the *Arthritis*, and making his moan and continual complaints thereof; by the counsel and advice of *Nicolaus Piso*, in the flower of his Age, he wholly denyeth unto himself the use of Wine, although he were the principal of those that were set over and had the charge of a Wine-Cellar (a rare example indeed of admirable temperance) and so by thus doing he kept himself for thirty years together (al the time of his life after) altogether free from those pains. And Histories likewise testifie, that some even by a due and orderly regulating of their lives, and others again by their being reduced unto poverty, and so necessitated unto a frugality in point of Dyet, have thereby been wholly freed and delivered from the Gout. And this withal is a thing most strange and wonderful (of which *Guilhelm. Fabricius* relateth three examples, in his *First Cent.* and 79. *Observat.*) that some certain Arthritick persons there have been, who upon suspition of some Notorious Offences by them committed,

committed, have been oftentimes ſet upon the wrack, and put upon the extreameſt of all exquiſite Tortures; but when they have conſtantly maintained their own innocency, they have at once been abſolved and for ever ſet free from their Crimes, and withal from the fits of the Gout, with the which they had formerly been moſt grievouſly afflicted. And wonderful alſo is that example which the ſame Author (in his firſt *Cent. Epiſt.* 47.) relateth of a certain envious and malecontented Perſon that lay ſick of the Gout; who though he were faſtened unto his ſick Bed by his painful Diſeaſe, could not yet refrain from traducing and ſpeaking ill of others. Which when a merry conceited Fellow there preſent perceived (who had alſo himſelf been laſht by the petulancy of the others Tongue) about the dusk of the Evening (taking his opportunity when the ſick Perſon was left all alone by all his Family) enters the ſick mans Houſe privily in a ſtrange diſguiſe that he had gotten, like unto an Æthiopian or Blackmoor, and thus diſguiſed he goeth neer unto the Bed-ſide of the ſick Perſon; who aſtoniſhed with the unuſualneſs of the form, his own ſolitarineſs, and withall terrified with the darkneſs of the place it ſelf that he lay in, demandeth of him who he was, and from whence he came. The Whiſler anſwering to none of his Queſtions, but making his approach cloſer unto the Bed-ſide catcheth him by the Arms (which were likewiſe much troubled and pained with the *Arthritis*) and having thus laid hold on him he throweth him upon his back, and ſo hanging upon the ſame and crying out with all the noiſe he could make, he carrieth him out of the Chamber where he lay, ever and anon cruſhing his Feet againſt the Stairs by which he was to go down. When he was come into the Yard, he there ſets down his burden, putting the ſick Perſon upon his Feet, ſpeaking not a word to him all this while, only ſtaring him ful in the Face. And then ſuddenly again he runs towards him and made as though he would once more have ſeized upon him, and ſo have carried him out of the Houſe. But now he who before could not ſo much as ſet his Feet to the Ground, by reaſon of his Diſeaſe, nor walk at all upon plain Ground, much leſs get up any whither by the Steps, now runs as faſt as he could up Stairs, and to the top of them he gets, and ſo into his Bed-Chamber he comes, and thorow the Window with the loud noiſe he made all the Neighborhood was raiſed, and ſo come running in unto him to ſee what the matter was. He out of Breath as he was, and half dead with affrightment, tels them that he was by a Ghoſt dragg'd out of the Bed where he lay, and then being carried forth of his Lodging-room he was moſt miſerably handled; and that had he not often called upon and ingeminated the name *Jeſus* he had without doubt been gone, had there been no more men in the world: And wonderful indeed it was, that he who was before ſo ſorely afflicted with the Gout ſhould hereupon recover his health and ſtrength, and never after be troubled with any the leaſt fit of his former Diſeaſe. *Fabricius* hath there likewiſe another Hiſtory of a certain Malefactor that had the Gout, who being brought forth and led unto Execution (his puniſhment being to have his Head cut off) by that time he was come half way to the place of execution there was brought him an unexpected Pardon granted him by the Clemency of his Gracious Prince. The miſerable man was ſo affected with this good tidings, that he who til now wanted the uſe of almoſt all his extream Members, now on a ſuddain caſt himſelf on his Feet with a quick and ſpeedy motion, and lived after this for many yeers wholly free from all kind of pain and trouble that formerly he had undergone by reaſon of the Gout. And I my ſelf remember likewiſe that we had here with us not long ſince a Noble Youth, much troubled with the Gout; this Youth, the neer neighboring houſes happening one Night to be all on Fire, and the Houſe wherein he was in danger to be burnt, he ſuddenly for fear gets him out of his Bed, and down a Ladder he runs; and intending to fly into another Houſe, he fell (with that Foot where his grief lay) into a pit which the Winters Ice had made, it being now ful of Water; and ſo by this means was freed not only from the preſent fit, but likewiſe from al other pains of the Gout for the future; and ſo he lived many yeers after. Neither have we only examples of thoſe who either by an exact and accurate Diet, or by affrightment, or Joy, and the like means, have been delivered from the Gout; but we have examples of them likewiſe who have been recovered by the help of Medicaments. *Cardanus* (in his B. of admirable Cures, Numb. 16.) relateth four examples of ſuch as he himſelf had recovered of the Gout. And we have likewiſe other examples mentioned; of which we find certain of them in *Schenkius* his fifth Book of Obſervat. And *Solenander* alſo (in his 5. *Sect. Conſil.* 1.) writeth in this manner: *As we have* (ſaith he) *known many that have been cured by others, ſo we have alſo our ſelves ſet many free from the Gout for divers yeers together; and this we have done by curing them without any great ado, who before every half yeer (and ſomtimes oftner) were greatly afflicted with the Gout: of whom ſome are yet alive to teſtifie the truth of what I ſay.* And very remarkable is that

which

which *Carolus Piſo* (in the place alleadged) relateth in this manner: *One* Cornelius Perdeus Picardus *(a man well skilled in Rhetorick) was ſubject unto the Gout, from the ſeventh yeer of his age, and ſo forwards, the Arthritis returning oftentimes every yeer, and much hindering him in the proſecution of his ſtudies. This Patient adviſing with Carolus Piſo, and beſeeching him to afford what eaſe he could unto his intollerable pain, had ſo comfortable an anſwer from him, that it much cheered the yong man: for he promiſed him his deſire, if he would but only yield obedience unto theſe few Precepts of his; to wit, If he would indeed by degrees with-hold from himſelf a third part at the leaſt of his dayly allowance, and more eſpecially in that of his Drink; and in the firſt and chief place, if he would altogether abſtain from Wine; and then in the next place, if he would alwaies as careſully and exactly keep himſelf from the injuries of the Air, and eſpecially from the cold; and moreover alſo if in the night he would cover himſelf ſufficiently with Bedcloaths, ſo that conſtantly every morning, about the end of his ſecond ſleep there might appear upon his body, if not a ſweat, yet at leaſt a moiſtneſs and dewineſs as it were; and if (laſtly) he would with the Syrup of white Roſes (taken three or four times every month) purge out of his body all the ſerous or wheyiſh ſuperfluities. The yong man yieldeth obedience unto theſe Precepts for two yeers and ſomwhat more; and by this means (beyond all mens expectations) he prevented and cut off all the matter and fewel of his Diſeaſe, and ſo lived altogether free from all pain whatſoever in his joynts.*

And therefore certain it is from dayly experience, and the obſervations of Phyſitians, that many there have been troubled with the *Arthritis*, who have not been recovered and cured thereof; and on the contrary likewiſe that very many have been perfectly recovered of the ſaid Diſeaſe. Now who they be that are Curable *Hippocrates* teacheth us, 2 *Prorrhet. I am confident* (ſaith he) *and I ſpeak it ſo far as I know, or ever yet heard of (touching thoſe that are troubled with the Gout) that whoſoever of them are either aged, or have Callous and hard knobs and knots growing about their joynts, or ſuch of them as live careful and ſorrowful lives, having their bellies hard and coſtive, that al and every of theſe are (for ought I know) altogether incurable by the art of man. Indeed the Dyſentery (if it chance to happen upon it) is the beſt curer of thoſe ſick perſons; and ſo indeed alſo are other ſcourings very beneficial and profitable in this caſe, if they reach unto the lower parts. But as for ſuch as are yong, and have no hard knots as yet growing about their Joynts; if they live accurately and carefully in point of Dyet, if they be ſuch as love to ſtir by laboring and exerciſing themſelves, and ſuch as have a good mind to obey the Preſcripts of Phyſitians (every one as he is able, according to his ſeveral employment and ſtudy) theſe without doubt (if they adviſe with an underſtanding and expert Phyſitian, may be perfectly cured.* Thus *Hippocrates.* Yet nevertheleſs we may very rightly and deſervedly account the hereditary *Arthritis* among thoſe Gouts that are altogether incurable. For as al other Diſeaſes that are Hereditary, ſo likewiſe the Hereditary *Arthritis* is not to be removed and overcome without much difficulty, if ever it be done.

Now there are many Reaſons to be given, why divers of thoſe that are of themſelves curable, are yet never cured. For firſt of all, the cauſe is oftentimes in the Phyſitian, who is not ſufficiently expert in the Nature of this Diſeaſe, and the cauſe thereof. For when as there are ſo many Phyſitians that think amiſs of the Nature of this Diſeaſe, and cheriſh in themſelves falſe and erroneous Opinions touching the ſame; it is indeed no wonder, that theſe do not rightly cure it, ſince that of a Diſeaſe unknown (and the nature and cauſe thereof not underſtood) there can be no right and methodical Cure expected. And there are many Phyſitians likewiſe that with Leaden Weapons (as I may ſo ſay) fight againſt an Enemy ſo powerful and obſtinate. And then again ſecondly, the cauſe may be in the ſick perſons themſelves; who uſually offend in three things. For moſt of them are perſwaded that this their Malady is incurable; and therefore they never trouble their heads with thoughts of Phyſitian or Phyſick, neither wil they adviſe with the skilful Artiſt, but ſuffer the Diſeaſe (that at firſt might have been cured) to take ſuch deep root that it is now become altogether incurable. And ſecondly, As for ſuch of them who do conſult the Phyſitian, they likewiſe offend in three things; the firſt whereof is this, That for ſuch as are indeed able and expert, they for the moſt part ſleight theſe, and give credit unto Empericks, conſulting with every Mountebank they meet withal; by whoſe tampering with them the Diſeaſe is made the worſe, and the harder to cure. And ſecondly, they wil not continue the uſe of the Medi-ments long enough. For that that vitious diſpoſition in the body (which maketh very much for the augmenting and confirming of the Diſeaſe) as alſo that the vicious humors themſelves may be taken away (after they have by degrees been collected and heaped together) is

is not ſufficient that the ſick perſon be purged once or twice every yeer; but it will be very needful to continue the uſe of the Medicaments according to the Phyſitians preſcripe; and therfore we find the Ancients giving their Arthritick Pouders for a whol yeer together. And thirdly, another thing wherein they offend is this, That moſt of thoſe that are Arthritick deſire only the mitigation and aſſwagement of their preſent pain; and ſo that they may but be freed from the Paroxyſm they lie under, they think that the worſt is now paſt; never ſo much as troubling themſelves in adviſing, how and by what means they may prevent the like fits for the future. And laſtly, this is alſo a chief and almoſt the principal cauſe of *Arthritis* its being ſo ſeldom cured, That there are but very few who wil be perſwaded to keep an exquiſite and accurate Dyet; and they wil chuſe rather to endure the Arthritick pains, unto which they have been ſo long accuſtomed and inured, than ſubmit themſelves unto the Laws and Rules of a more ſtrict and ſevere courſe of Dyet. And very few there are of them that will deny themſelves the uſe of Wine, the drinking of which unleſs it be omitted, there is in very many Patients no hope at al of a perfect cure. And from hence it happeneth, that there are more of the Rich, and perſons of Quality that are troubled with the Gout, than there are of the poorer ſort of people, and Peaſants; in regard that theſe laſt keep a very ſpare dyet, and drink no Wine at al; whereas thoſe former guzzle in Wine too freely; and in many other points of Dyet offend far more than the poor. Neither yet notwithſtanding is this at all to be denied, That there are ſome, who although they do not commit any notorious errors in the courſe of their Dyet, yet they can hardly be freed from the Gout, becauſe that the greateſt part of their Aliment (by reaſon of the weakneſs of their bowels) is converted into vitious humors, like as we ſee that there are in others alſo vitious humors elſwhere collected. And therefore in regard that it is oftentimes impoſſible to correct that weakneſs of the bowels, the *Arthritis* likewiſe from thence proceeding wil ſcarcely ever be cured.

Queſt. 11. *Whether it be fit to purge in the beginning of the Arthritick Paroxyſm?*

THere are divers and different Opinions of Phyſitians as touching this point. For ſome there are who affirm that in the very firſt beginning of the Paroxyſm purges are therefore to be adminiſtred, that ſo by them the Humors may be drawn back from the Joynts, and that ſo the pains may be leſſened, and the fits made ſomwhat ſhorter. And they appeal likewiſe unto Experience; by which it appeareth that upon the adminiſtring of Purgations in the beginning of the Paroxyſm the ſick perſon hath been delivered from al the pain that attendeth the fit; like as before we told you of *Petrus Bayrus*, who writeth of himſelf, that he was ſo weak and impotent, that he could move no part about him but only his Tongue; and that he was carried and put upon his Cloſe-ſtool by four men; but having taken his Caryocoſtine Electuary, and after that his belly had been thereby five times looſened, and made ſoluble, he found ſuch eaſe from al his former pains, that now he could go and eaſe himſelf without any help at all, and ſo in like manner return from the Cloſe-ſtool; and that he was able alſo the very ſame day to walk from one end of his ſtudy unto the other.

But others there are, that maintain the contrary Opinion; and theſe tel us, That if the humors be moved by a purging Medicament, they then ruſh unto the Joynts and the part affected more vehemently, and with greater force and violence, as alſo in greater abundance; and ſo they excite and cauſe the greater pains. And theſe alſo refer themſelves unto Experience, by which it wil be found, that by the uſe of Purging Medicaments the pains have not only been augmented, but that likewiſe if the Purges were ever a whit more hot, and ſtronger than ordinary, the humors were then inflamed by them, and drawn unto the internal and more noble parts, and there excited burning Feavers that were both dangerous and deadly.

Ludovicus Septalius (in the 7. B. of his Animadverſions, Numb. 177.) writeth, That by forty five yeers Experience he had found that Purgations adminiſtred in the beginning of the *Arthritis* ſucceeded wel in ſome, but that others again had no benefit at al by them; and therefore he giveth us this diſtinction; When there is (ſaith he) preſent in the *Arthritis* both a fluent matter, and a ſtrength of the part expelling, as alſo a weakneſs of the recipient or part receiving; If the abundance of matter, or the ſtrength of the part expelling ſhall appear to be prevalent, then (without any further controverſie) that matter is with al ſpeed to be evacuated, and called away from the Joynts, either by a Vomit, or elſe by ſome purging Medicament. But if the looſneſs and weakneſs of the Joynts be the cauſe of the fluxion, ſo that upon every light occaſion, and whatſoever the quantity of the matter be, Nature be ſtill attempting to thruſt forth the ſaid matter (ſo ſoon as it is collected in the body) unto the Joynts, the (as he tels us) upon the taking of a purge, as the fluxion is thereby augmented,

mented, ſo Nature is likewiſe thereby rendered more weak and infirm.

But in very truth, this is a thing indeed moſt certain, That the matter doth ruſh unto this or that part with ſomtimes a greater, and ſomtimes a leſs violence and impetuouſneſs: but as for the cauſe of this fluxion, it is never the alone weakneſs of the Joynts (which only diſpoſeth the part for the more eaſie receiving of the matter, but never draweth or alureth the humor unto the part affected) but that it ſomtimes rutheth more eaſily unto this, and ſomtimes unto that part, this is rather to be aſcribed unto the Expulſive faculty, which is accuſtomed now unto this, and as ſoon again unto that way and part, for the expelling forth of the peccant humor. And therefore if there be any Fear of the matters ſudden and violent ruſhing upon the part, purgation is not thereupon preſently to be omitted; but rather ſuch a purge is to be adminiſtred that may not only move the humors, but that is able alſo wholly to evacuate them. But yet nevertheleſs, it is here the ſafeſt courſe (as *Septalius* perſwadeth us) to conſult Experience. For if we find that the pains are the more exaſperated upon the giving of a Purge once or twice, and that thereupon they continue the longer, we muſt then forbear to purge for the future. But on the contrary, if we find the pains to be hereby diminiſhed, and the Paroxyſm made more eaſie and light, we may then alſo even with boldneſs and confidence go on to purge, as there ſhal be occaſion. But it is moſt fit and convenient to purge, even at firſt, in the very beginning of the Diſeaſe. For whenas the impetuous motion of the humor unto the part affected is not as yet altogether ſo great, the humor may eaſily be drawn another way; whereas if it already with great violence ruſh unto the part affected, it is the harder to be recalled. But leſt that otherwiſe ſome Feaver ſhould be kindled, the condition of the humors, and the nature of the purges, are wel to be weighed and conſidered; and they are ſo to be tempered, that no ſuch thing may happen.

Queſt. 12. *Whether Baths be good and uſeful for ſuch as are troubled with the Gout?*

BAths are by many Phyſitians commended unto Arthritick perſons; and many alſo thus affected betake themſelves unto theſe Baths, as unto the only ſacred Anchor of their Hopes, and a moſt ſure Refuge, as from whence they expect an eaſing of al their pains and tortures. But yet on the contrary, Experience hath often taught us, that ſome even in thoſe very baths have fallen into the fits and pains of the Gout; and that others likewiſe by the uſe of the ſaid Baths have become much the worſe. And therefore ſeeing that there is a Truth in both theſe Aſſertions; to wit, That Baths are ſomtimes uſeful and good for Arthritick perſons, and now and then likewiſe very hurtful for them; we muſt firſt of all know that from Baths alone there was never yet any that ever recovered (or could ſo much as probably hope for) his perfect health and ſtrength. Neither alſo doth the *Arthritis* (as we ſhewed you before) proceed only from the weakneſs of the joynts; neither is it ſufficient to ſtrengthen the joynts, that the ſick perſon may be cured of the Gout. And moreover, that the Baths do ſomtimes help, and ſomtimes hurt the perſon thus affected, this is not to be aſcribed meerly and ſimply unto the Baths, but unto the conſtitution of the ſick perſon, and likewiſe the courſe of Dyet by him obſerved whilſt he made uſe of thoſe Baths. For if the Body ſhal be firſt rightly evacuated, ſo that there are only the reliques and remainders to be conſumed, and that the Joynts be to be ſtrengthened, Baths may then be allowed as very fit and profitable for the ſick perſon. For they do more powerfully diſſolve and diſſipate the remainders of the Humors in the joynts than do any Medicaments whatſoever, and ſo ſtrengthen the parts; and withal (if the uſe of them be temperate) they cheriſh and preſerve the Native heat of the Body. But if the Body be ſtill impure, and as yet ful of vitious humors, the Baths melt and pour al abroad theſe vitious humors; whereupon the ſick perſons ſomtimes fal into their fits in the very Baths, and ſo are forced to deſiſt from any further uſe of them; or elſe theſe humors being ſcattered and poured abroad are carried into the other parts, and unto the bowels; and there they cauſe many dangers and miſchiefs. And ſo we may even very truly conclude, that Baths are more hurtful than helpful unto perſons in this condition, unleſs they obſerve a right and due courſe of dyes, while they make uſe of them.

FINIS.

Books Printed by Peter Cole, *Printer and Book-seller of* LONDON, *at the Exchange.*

Several Physick Books of Nich. Culpeper *and* A. Cole, &c.

1 Idea of Practical Physick in twelve Books.
